A large gallatorial bird with very long legs and neck, a long straight bill with pervious nostrils near its middle, the head usually naked, at least in part, the hind toe elevated, and the inner secondaries usually enlarged; any bird of the family *Gruidae*. There are about 15 closely similar species, found in many parts of the world, most of them included in the genus *Grus*. The common crane of Europe is *G. cinerea*; it is about 4 feet long. The gigantic crane of Asia is *G. leucogeranus*, and a common Indian crane is *G. antigone*. The wattled crane of South Africa is *Grus (Buceros) carunculata*. **crane**<sup>2</sup> (krān), *n.* [A particular use of *crane*<sup>1</sup>, the arm of the contrivance being likened to the neck of a crane. word for *crane*, a bird. The resemblance of Gael. and Ir. *crann*, a beam, mast, bar, tree, > *crannachan*, a crane (Ir. also a crane), is prob. accidental.] 1. A machine for moving weights, having two motions, one a direct lift and the other horizontal. The latter may be circular, radial, or universal. The parts of the simple crane are an upright post having a motion on its vertical axis, a jib or swiveling arm jointed at its lower end to the post and tied to the post at its outer or upper end, and hoisting tackle connecting the motive power at the foot of the post with the load to be lifted, which is suspended from the end of the jib. Cranes are, however, made in a variety of forms, differing more or less from this type. Thus, a *rotary crane* is a crane in which the jib has simply a rotary motion about the axis of the post, moving with the post; a *traveling crane* is a crane in which the load is suspended from a carriage moving upon a long truss that travels upon elevated rails. See cut. In some fixed cranes the load is suspended from a carriage that travels on a horizontal arm at the top of the jib, and gives the load a movement along the radius of the circle formed by the rotation of the jib. Another minor type is the *derrick-crane*, with fixed guys to hold the post in position. Cranes (called *walking-crane*) traveling upon rails have been used in navy-yards. Cranes are operated by any kind of power and with any form of hoisting apparatus suited to the work to be done. See also cut under *abutment-crane*.

A bent or vertical arm attached to or projecting at an angle from an axis at one end, and with provision for the application of power at the other, used for communicating circular motion, as in a grindstone, or for changing circular into reciprocating motion, as in a saw-mill, or reciprocating into circular motion, as in a steam-engine. The single *crank* (1) can be used only on the end of an axis. The double *crank* (2) is employed when it is necessary that the axis should be extended on both sides of the point at which the reciprocating motion is applied. An exemplification of this arrangement is afforded by the machinery of steam-vessels. The bell-crank (3), so called from its ordinary use in bell-hanging, performs a function totally different from that of the others, being used merely to change the direction of a reciprocating motion, as from a horizontal to a vertical line.

When first introduced, it was commonly of lace, or of linen edged with lace. At the beginning of the seventeenth century it was worn very long, and it is often seen in pictures passed through the buttonhole of the coat or waistcoat.

(See *steinkirk*.) The modern cravat is rather a necktie, passed once round the neck, and tied in front in a bow, or, as about 1840 and earlier (when the cravat consisted of a triangular silk kerchief, usually black), twice round the neck, in imitation of the stock. Formerly, when starched linen cravats were worn, perfection in the art of tying them was one of the great accomplishments of a dandy. The cravat differs properly from the scarf, which, whether tied, or passed through a ring, or held by a pin, hangs down over the shirt-front. In England *neckcloth* is the usual word in this sense.

**creed** (krəd), *n.* [*< ME. credo* (sometimes, as L., *credo*), < AS. *crēda* = Icel. *krēdda* (also, after L., *krēdo*) = MHG. *crēde* (cf. Gael. *crē*); in other languages usually in L. form, OF. F. Pr. Sp. Pg. It. *credo*, *creed*; < L. *credo*, I believe, the first word of the Latin version of the Apostles' and Nicene creeds; 1st pers. sing. pres. ind. act. of *credere*, believe, trust, confide: see *credit*, *v.*] 1. A statement of belief on any subject, religious, political, scientific, or other; especially, a formal statement of religious belief; a "form of words, setting forth with authority certain articles of belief which are regarded by the framers as necessary for salvation, or at least for the well-being of the Christian Church" (*Schaff*, The Creeds of Christendom, I. i.). In the Protestant churches the authority of creeds is relative and limited, and always subordinate to the Bible as the only infallible rule of faith and practice. In the Greek and Roman Catholic churches the creed of the church is regarded as of equal authority over the believer with the Bible. The principal historical creeds of Christendom are the following: the *Apostles' Creed* (see *apostle*) and the *Nicene Creed* (see *Nicene*), the latter formulated in the fourth century, and generally accepted by Christian churches. Protestant, Greek, and Roman Catholic; the *Athanasian Creed* (see *Athanasian*), retained by the Church of England, but not by the Protestant Episcopal Church in the United States, nor by other Protestant communities; the *Decrees of the Council of Trent* (A.D. 1563), the great symbol of Roman Catholicism; the *Orthodox Confession of Nigilas* (seventeenth century), and the creed ratified by the Synod of Jerusalem (1672), both recognized by the Greek Church; the *Augsburg Confession* (1530), the symbol of the Lutheran Church; the *Helvetic Confessions* (two confessions, a first and a second Helvetic Confession, 1536, 1566), adopted by Swiss theologians as a statement of the reformed faith of the Swiss churches; the *Westminster Confession of Faith* (1647), the symbol of the Presbyterian Church; the *Canons of the Synod of Dort* (1619), aimed especially at Arminianism, and still regarded as a symbol of doctrine by the Reformed Church of the Netherlands and the Reformed (Dutch) Church in America; the *Thirty-nine Articles* (1563-71) of the Church of England and (revised in 1801) of the Protestant Episcopal Church in the United States; the *Savoy Confession* (1658), a Congregationalist symbol, and formerly generally accepted by Congregationalists; and the *Twenty-five Articles of the Methodist Episcopal Church* (1784), of which the first twenty-four were prepared by John Wesley, on the basis of the Thirty-nine Articles of the Church of England. A number of other special declarations of faith by other Protestant bodies are of less historical significance. The word *creed*, however, in its strict sense applies only to comparatively brief formulas of profession of faith (as the Apostles' Creed), beginning with the words "I believe" or "We believe," and intended to be used at baptism or reception of converts, or in public worship.

The revival of the practice in a more efficient manner has been advocated in recent times for sanitary reasons, and to some extent effected. Various methods of cremation have been proposed, the great difficulty being to consume the body without permitting the escape of noxious exhalations, and without defiling the ashes with foreign substances. In W. Siemens's apparatus (a modification of the plan of Sir Henry Thompson) the body is exposed to the combined action of highly heated air and combustible gases, so as to be entirely consumed without foreign admixture, while the furnace is so constructed that no noxious effluvia escapes from it.

Fr. *cricot*, a cricket; with dim. term. *-et* (-ot), equiv. to MD. D. *kreket* = MLG. *krikel, krekel*, > G. *kreckel*, a cricket (cf. 'creaker', 'little creaker'), from the imitative verb, F. *criquer*, creak, E. *crick*, *creak*: see *crick*, *creak*.] Any saltatorial orthopteron insect of the family *Gryllidae* (or *Achetidae*), or of a group *Achetina*: sometimes

extended to certain species of the related family *Locustidae*. In both these families the antennae are very long and filamentous, with sometimes upward of 100 joints, and the ovipositor is often very large. It is to the saltatorial forms, as distinguished from the *Achetidae* (grasshoppers), that the name *cricket* is usually applied. The best-known species is the common house-cricket, *Acheta* or *Gryllus domestica*. The field-cricket is *Acheta* or *Gryllus campestris*: the mole-cricket, *Gryllotalpa vulgaris*; the grand cricket of New Zealand, *Anostoma* or *Dinacrida heteracantha*. See also *sand-cricket*.

**cricket** (krik'et), *n.* [The game is first mentioned in A. D. 1598; evidently a popular name, poss. a particular use of *cricket*, a low stool, in allusion to the appearance of the wickets or sticks in the original game. Some cite OF. *criquet*, a stick which serves as a mark in the game of bowls (Roquefort).] An open-air game played with bats, ball, and wickets, long peculiar to England, but now played throughout the British empire and elsewhere. There are two opposite sets or sides of players, numbering 11 players each. Two wickets of 3 stumps 17 inches high, with 2 balls each 4 inches long on top, are placed in the ground 22 yards apart. A straight line, 6 feet 8 inches in length, known as the bowling-crease, is drawn on the ground, through the wickets, which must be in the middle of this line. Behind this the bowler must stand. Four feet in front of this is another line, known as the *popping-crease*, of at least as great a length as the bowling-crease; between these two the batsman stands. After the rival sides have tossed for the choice of taking the bat or fielding, two men are sent to the wickets, bat in hand. The opposite or fielding side are all simultaneously engaged: one (the bowler) being stationed behind one wicket for the purpose of bowling his ball against the opposite wicket,

Cricket-field.  
1, bowler; 2, wicket-keeper; 3, long-stop; 4, slip; 5, point; 6, cover; 7, cover-point; 8, mid-off; 9, long-leg; 10, square-leg; 11, mid-on; S, S, batsmen; U, U, umpires; a, a, popping-creases; b, b, bowling-creases.

where another player (the wicket-keeper) stands ready to catch the ball should it not be batted; the other fielders are placed in different parts of the field, so as to catch or stop the ball after it has been struck by the batsman or missed by the wicket-keeper. Their positions and names are shown in the diagram. It is the object of the batsman to prevent the ball delivered by the bowler from knocking the balls off his wicket, either by merely stopping the ball with his bat or driving it away to a distant part of the field. Should the ball be driven to any distance, or not stopped by the wicket-keeper, the two batsmen run across and exchange wickets once or more. Each time this is done is counted as a "run," and is marked to the credit of the striker. If the batsman, however, allows the ball to carry away a ball or a stump, either when the ball is bowled or while he is running from wicket to wicket, if he knocks down any part of his own wicket, if any part of his person stops a ball that would otherwise have reached his wicket, or if he strikes a ball so that it is caught by one of the opposite party before it reaches the ground, he is "out"—that is, he gives up his place to one of his own side; and so the game goes on until 10 of the 11 men have played and been put out. This constitutes an "innings." The side in the field then take their turn at the bat. Generally after two innings have been played by both sides the game comes to an end, that side winning which has scored the greater number of runs. A rude form of the game is known to have been played in the thirteenth century.

Sometimes confined to prosecution by indictment.—**Criminal psychology.** See *psychology*.—*Syn.* 2. *Illegal, Criminal, Felonious, Sinful, Immoral, Wicked, Iniquitous, Depraved, Dissolute, Vicious*, agree in characterizing an act as contrary to law, civil or moral. All except *illegal* and *felonious* are also applicable to persons, thoughts, character, etc. *Illegal* is simply that which is not permitted by human law, or is vitiated by lack of compliance with legal forms: as, an *illegal election*. It suggests penalty only remotely if at all. *Criminal* applies to transgressions of human law, with especial reference to penalty. *Felonious* applies to that which is deliberately done in the consciousness that it is a crime; its other uses are nearly or quite obsolete. *Sinful* and the words that follow it mark transgression of the divine or moral law. *Sinful* does not admit the idea that there is a moral law separate from the divine will, but is specifically expressive of "any want of conformity unto, or transgression of, the will of God" (*Shorter Catechism*, Q. 14). As such, it applies to thoughts, feelings, desires, character, while human law looks no further back of action than to intent (as, a *criminal intent*), and attempts to deal only with acts. Hence, though all men are *sinful*, all are not *criminal*. *Immoral* stands over against *sinful* in emphasizing the notion of a moral law, apart from the question of the divine will; its most frequent application is to transgressions of the moral code in regard to the indulgence of lust. *Wicked* bears the same relation to moral law that *felonious* bears to civil law; the *wicked* man does wrong wilfully and knowingly, and generally his conduct is very wrong. *Iniquitous* is wicked in relation to others' rights, and grossly unjust: as, a most *iniquitous* proceeding. *Depraved* implies a fall from a better character, not only into wickedness, but into such corruption that the person delights in evil for its own sake. *Dissolute*, literally, set loose or released, expresses the character, life, etc., of one who throws off all moral obligation. *Vicious*, starting with the notion of being addicted to vice, has a wide range of meaning, from cross to wicked; it is the only one of these words that may be applied to animals. See *crime*, *atrocious*, *nefarious*, and *irreligious*.

A subject may arrest for treason: the King cannot; for, if the arrest be *illegal*, the party has no remedy against the King. Quoted in *Macaulay, On Hallam's Const. Hist.*

**Crinoidea** (kri-noi'dē-ä), *n. pl.* [NL., < Gr. *κρίνον*, like a lily, < *κρίνον*, a lily, + *είδος*, form.] A class of the pelmatozoan branch of the *Echinodermata* containing those forms which, during the whole or the early part of their existence, are fixed by a jointed, flexible stalk or are attached by the lower surface of the body: so named from the resemblance of their rayed bodies,

*Rhinocrinus leptentis.*

borne on a stalk, to a lily. The principal viscera are inclosed in a cup-shaped or globose calyx, the lower part of which—the dorsal or aboral surface—is composed of calcareous, close-fitting plates and usually rests on the peduncle or stalk; its upper surface—the ventral—is either plated or membranous; the mouth is situated here, but is usually subterminal in Paleozoic forms. The arms, or crown, arise from the upper part of the calyx and are the direct prolongation of the radial plates of the dorsal calyx. These arms bear lateral branches or pinnules; both are traversed ventrally by a deep groove, at the bottom of which is situated the coelac canal. Overlying the latter run the genital, water, and vascular canals, a nerve-cord, and two rows of tentacles passing out from the ambulacra. These arm-furrows lead downward into the tegmen and to the mouth. The *Crinoidea* were enormously abundant in Paleozoic time, when they attained their culmination. Their fossil remains are popularly known as stone-lilies, lily-stars, encrinites, etc. They sometimes constitute entire strata of limestone. In recent seas crinoids are of relatively rare occurrence and are represented by only a very few genera. In the accepted classification, the class is divided into five orders: *Loriciformia*, *Camerata*, *Pistulata*, *Flabellites*, and *Articulata*. Also called *Brachiata*.

Crinoline is still in use for stiff lining and the like, in the manner of buckram.

**Crocodylia** (krok'ō-dil'i-ā), *n. pl.* [NL., < L. *crocodilus*, crocodile.] An order of *Reptilia*, formerly included with *Lacertilia* in *Sauria*, now separated as the highest existing reptiles. They are lizard-like in form, with long tails and four well-developed limbs, the anterior shorter than the posterior and with five complete digits, and the posterior four-toed. With a single exception, the living species have nails on the three radial and tibial digits; the feet are webbed; the nostrils are at the end of a long snout, and can be closed; and the tympanic membranes are exposed, but a cutaneous valve can be shut down over them. The skin is loricate, the dermal armor consisting of bony scutes covered with epidermal scales of corresponding form; the anus is longitudinal, as in the chelonians; as in the penis is single, and lodged in the cloaca; the teeth are distinctly socketed; the lungs are confined to the thorax; the heart is completely four-chambered, but the aortic arches communicate by the foramen Panizzae, so that venous and arterial blood commingle outside the heart; the spinal column is well ossified; the vertebrae are mostly procervical, as in all the existing species, amphiceleous or opisthocleous in some extinct forms; the sacral vertebrae are reduced to two; the cervical bear free ribs; the ribs are bifurcated at their proximal ends; there is a series of so-called abdominal ribs disconnected from the vertebrae; and the skull is well ossified, with an interorbital septum, large alisphenoids and parotic processes, large fixed quadrates, ectopterygoids, completely bony tympanic cavities, rudimentary orbitosphenoids, if any, and no parietal foramen. The order ranges in time from the Oolitic strata to the present day, and contains all the huge saurians known as crocodiles, alligators, caymans, jacarés, gavials, etc. All the species are more or less aquatic, though none of the living ones is marine. The order has been divided into the five families *Alligatoridae*, *Crocodylidae*, *Gavialidae*, *Teleosauridae*, and *Belodontidae*, the last two including only extinct forms. Other names of the order are *Loricata*, *Emydosauria*, and *Hydrosauria*. Other divisions of the order than those above given are: (1) by Owen, into three suborders, *Procelaria*, *Amphicelia*, and *Opisthocelia*; and (2) by Huxley, likewise into three suborders, *Parasuchia*, *Mesosuchia*, and *Eusuchia*.

The family includes two genera: *Crocodilus*, represented by the crocodile of the Nile, *C. niloticus*, and other species; and *Mecistops*. See cuts under *crocodile* and *Crocodylia*.

True or membranous croup is inflammation of the larynx (laryngitis) with fibrinous exudation forming a false membrane. Many if not all cases of true croup are diphtheritic in nature. False croup is simple or catarrhal laryngitis, not resulting in the formation of a membrane, but inducing at times spasm of the glottis. Spasmodic croup, or *laryngismus stridulus*, is a nervous affection characterized by attacks of laryngeal spasm independent of local irritation: popularly called *crouping convulsions*. **croup** (krōp), *n.* [Also dial. *croup*, early mod. \***crow**<sup>2</sup> (krō), *n.* [*< ME. crow, crowe, crawe*, < AS. *krāwe* = OS. *krāia* = D. *kraai* = MLG. *krā*, *krāwe* = OHG. *chrāja*, *chrāwa*, *chrāa*, *chrā*, MHG. *krā*, *krāje*, G. *krāhe*, a crow, a raven; from the verb, AS. *crāwan*, etc., *crow* (orig. in a general sense). Cf. E. dial. *crake*, a crow, Icel. *krāka*, a crow: see *crake*<sup>2</sup>, *croak*, etc.] 1. A general name including most birds of the genus *Corvus* and of the family *Corvidæ*; especially, one of the *Corvinæ*. See these three words. The larger kinds of crows are called *ravens*, especially those which have the throat-feathers lengthened, lanceolate, and discrete. The term, used absolutely, means in Great Britain the carrion-crow, *Corvus corone*, and in the United States the common American crow, *C. americanus*. The two species are so similar in all respects that they are only distinguished by slight technical characters. The plumage is jet-black, with a purplish and violet gloss or sheen, especially on the back, wings, and tail; the bill and feet are ebony-black; the base of the upper mandible is covered for a long distance with a bundle of antorse bristly feathers, filling each nasal fossa and hiding the nostrils. The eyes are bright and

intelligent, of a hazel-brown color. The feet are stout, with strong curved claws and scaly tarsal and toes. The tail is of moderate length, a little rounded or fan-shaped, of 12 broad plane feathers. The wings are lengthened and pointed, with 10 primaries, and when folded their tips fall nearly opposite the end of the tail. The length of these crows is 18 or 20 inches. Crows are among the most omnivorous of birds, eating almost everything from carrion to fruits. Some species, hence called *fish-crows*, are fond of fish and shell-fish, as mollusks and crustaceans. Crows usually nest in trees, where they build large bulky nests of sticks, and lay greenish eggs heavily spotted with dark colors, generally to the number of 4, 5, or 6. They are noted for their sagacity, and in populous countries become extremely wary and knowing birds, their instinct of self-preservation being developed to the highest degree by the incessant persecution to which they are subjected.

Opinions differ as to their being on the whole most beneficial or most injurious to the agriculturist, but they are generally classed as "vermin," and in some places a legal price is set upon their heads. Crows are eminently sociable birds, and however widely they may be dispersed in pairs in the breeding season, they flock at other times; and in winter, in many places in the United States, vast bands numbering hundreds of thousands assemble nightly to roost together, often flying 20 to 40 miles back to these *crow-roosts* at night after foraging over the country for food during the earlier hours of the day. The common American fish-crow is *C. ossifragus* or *C. maritimus*, an undersized species inhabiting southerly parts of the United States, especially coastwise, and feeding much on shell-fish. The northwestern fish-crow is *C. caurinus*, a similar though distinct species. The white-necked crow or raven is *C. cryptoleucus*, of western parts of the United States, in which the plumage of the neck beneath the black surface is snowy-white. A number of small crows resembling the fish-crow inhabit the West Indies, as *C. jamaicensis*. In some of these the face is partially naked, a character which is also conspicuous in the European rook, a kind of crow, *C. frugilegus*. The European daw, *C. monedula*, is another kind of crow. See also phrases below.

eastern United States: so called from its large size and dark color, which give it somewhat the appearance of a crow. The male is about 18 inches long and 17½ inches in extent of wings. The plumage is richly iridescent, with green, blue, violet, purple, and bronzy tints; the bill and feet are ebony-black; the iris is straw-yellow; the tail is somewhat boat-shaped. The female is blackish and quite lustrous, in this differing from some related species, and also a little smaller than the male. A variety has a perfectly brassy back and steel-blue head; it is sometimes distinguished as the *bronzed* crow-blackbird. The name is extended to the other species of the same genus. *Q. major* is a larger species of the southern United States, known as the *boat-tailed* crow-blackbird or *grackle*, and locally called *jack-daw*. The tail is much carinated, and the disproportion in size of the sexes is very great, the female being only about 13 inches long, while the male is 15½ to 17; the peculiar development of the tail is lacking in the female, and the color is plain grayish-brown, the male being richly iridescent black. A still larger species, the *fan-tailed* crow-blackbird, *Q. macurus*, also called *Texas grackle*, inhabits the Gulf States and Mexico; the male attains a length of 18 inches, while the female is much smaller. All these birds are gregarious, nest in trees and bushes, sometimes in holes, and lay 6 or 8 greenish eggs, clouded, veined, and scratched with various dark colors.

An ornament for the head; originally, among the ancients, a wreath or garland; hence, any wreath or garland worn on the head; a coronal. Crowns, made at first of grass, flowers, twigs of laurel, oak, olive, etc., but later of gold, were awarded in ancient Rome to the victors in the public games, and to citizens who had done the state some distinguished service. 2. An ornament or covering for the head worn as a symbol of sovereignty. Crowns were of very varied forms till heralds devised a regular series to mark the grades of rank, from the imperial crown to the baron's coronet. (See *coronet*.) 2. The crown of England is a gold circle, adorned with pearls and precious stones, from which rise alternately four Maltese crosses and four fleurs-de-lis. From the tops of the crosses spring imperial arches, closing under a mound and cross. Within the crown is a crimson velvet cap with an ermine border. The crown of Charlemagne, which is preserved in the imperial treasury of Vienna, is composed of eight plates of gold, four large and four small, connected by hinges. The large plates are studded with precious stones, the front one being surmounted with a cross; the smaller ones, placed alternately

with these, are ornamented with enamel representing Solomon, David, Hezekiah, and Isaiah, and Christ seated between two flaming seraphim. The Austrian crown is a sort of cleft tiara, having in the middle a semicircle of gold supporting a mound and cross; the tiara rests on a circle with pendants like those of a mitre. The Russian crown is a modified form of the same imperial crown. The royal crown of France is a circle ornamented with eight fleurs-de-lis, from which rise as many quarter-circles closing under a double fleur-de-lis. The triple crown of the popes is more commonly called the *tiara*. (See *diadem*.) In heraldry the crown is used as a bearing in many forms. When a coronet or open crown is used to alter or differentiate a bearing, whether on the escutcheon or as a crest or supporter, it is not blazoned by itself, but the bearing is said to be *crowned*; when it is placed around the neck of an animal, the animal is said to be *gorged*.

The petition-crown is a pattern or trial-piece for a crown of Charles II., bearing the petition of its engraver, Thomas Simon, praying the king to compare the coin with the crown of the Dutch engraver John Roettier, by whom Simon had been superseded.

to the crown or sovereign. The lands belonging to the British crown are now usually surrendered to the country at the beginning of every sovereign's reign, in return for an allowance fixed at a certain amount for the reign by Parliament. They are placed under commissioners, and the revenue derived from them becomes part of the consolidated fund.

The additional allowances thus granted by Parliament to the Prince and Princess of Wales, and other members of the Royal Family, amount to an annual charge of £156,000; and when it is remembered that the Crown lands alone surrendered to Parliament yield an annual income of nearly £380,000, it will be evident that the charge upon the nation for the support of the dignity of Royalty is by no means extravagant, as interested persons would sometimes have us believe.

Byzantine crucifixes of bronze exist of as early date as the tenth century, in which the flat surface of the cross is decorated with enamel, having the sun and moon as emblematic of creation witnessing the crucifixion; in these the body of Christ is generally partly clothed with a garment indicated in colored enamel. Crucifixes are used in many ways in the devotions and ceremonies of the Roman Catholic Church, being conspicuously displayed in religious houses and other situations, and worn upon the person by ecclesiastics and others.

Among the Romans, the instrument of death was properly either a cross in the form now familiar, or the cross known as St. Andrew's; sometimes a standing tree was made to serve the purpose. **crureus** (krö-ré'us), *n.* [*NL., < L. crus (crur-), leg.*] The principal and middle mass of muscle on the front of the thigh, forming a part of the great extensor of the leg, inseparable from the lateral portions of the same muscle called *vastus internus* and *vastus externus*. These three muscles, or parts of one muscle, arise from most of the front and sides of the femur; and their tendinous parts unite with the tendon of the rectus femoris to embrace the patella or knee-cap, and thence proceed, as the so-called *ligamentum patella*, to insertion in the tubercle of the tibia. The *crureus* and the two *vasti* together compose the muscle called *triceps extensor cruris*; when the rectus is included therewith, the whole is known as the *quadriceps extensor cruris*. The *crureus* proper of man is also called *medicrurus*, when the two *vasti* are known as the *extracrus* and *intracrus* respectively, and the rectus as the *recticrus*. See these words; also *sartorius*, *subcrureus*.

**crural** (krö'ral), *a.* [*= F. Sp. Pg. crural = It. crurale, < L. cruralis, < crus (crur-), the leg.*]

1. Pertaining to the leg or hind limb: as, a *crural* artery or vein; the anterior *crural* nerves; the *crural* arch, or Poupart's ligament.—2. Pertaining to the leg proper, or *crus*, as distinguished from the thigh; cnemial; tibial.—3. Pertaining to the *crura* or peduncles of the brain.—4. Shaped like a leg or root.—**Crural arch**, the ligament of the thigh. Also called *inguinal arch*, *ligament of Poupart*, etc.—**Crural area**. See *area cruralis*, under *area*.—**Crural artery**, the femoral artery.—**Crural canal**, the passage through which a femoral hernia passes. It lies on the inner side of the iliac vein, between it and the crural sheath, and extends from the crural ring to the upper part of the saphenous opening. It is a quarter to a half inch in length.—**Crural hernia**. Same as *femoral hernia* (which see, under *hernia*).—**Crural nerve**, the largest branch of the lumbar plexus, formed chiefly from the third and fourth lumbar nerves, with a fasciculus from the second, in the substance of the psoas muscle, and dividing into a large leash of nerves which supply all the muscles of the front of the thigh, excepting the tensor vaginæ femoris, and some other muscles, as the iliacus and pectineus, and also sending cutaneous nerves to the front and inner side of the thigh and to the leg and foot.—**Crural pores**, openings in the integument of the hind limbs of lizards, as in the genus *Sceloporus*, which takes its name therefrom. They are situated in the femoral, not the crural, segment of the limb. Also called *femoral pores*.

In the Sauri, the so-called *crural pores* lead into glands, which look like compound tubes, and which secrete cells which harden and fill up the lumen of the glands.

*Gegenbaur, Comp. Anat. (trans.), p. 420.*

**Crural ring**, the upper opening of the crural canal, leading into the abdominal cavity. It is bounded in front by Poupart's ligament and the deep crural arch, behind by the pubes, internally by the deep crural arch, Gimbernat's ligament, and the conjoined tendon of the transversalis and internal oblique muscles, and externally by the femoral vein.—**Crural septum**, the layer of subperitoneal connective tissue which spans the crural ring in a normal state.—**Crural sheath**, the sheath which incloses the femoral vessels as they leave the abdomen. It is a continuation of the fascia lining the abdomen, and becomes closely adherent to the femoral vessels about an inch below the saphenous opening; but above it is larger, and contains some areolar tissue, and frequently a lymphatic gland.—**Crural vein**, the femoral vein.—**Deep crural arch**, a thickened band of fibers arching over the beginning of the crural sheath. It arises from the middle of Poupart's ligament, and is inserted into the iliopectineal line.

**crusade**<sup>1</sup> (krō-sād'), *n.* [Early mod. E. also *crusado*, *croisade*, *croisado*, *croysado*, earlier *cruciade*, late ME. *cruciade*, *cruciat* (being variously accented to the ML., Sp., or F.); = F. *croisade* (after Pr.), OF. *croisée* (also in another form *croiserie*) = Pr. *croisada*, *crozada* = Sp. The earlier ME. word for 'crusade' was *croisery*: see *croisery*.] 1. A military expedition under the banner of the cross; specifically, one of the medieval expeditions undertaken by the Christians of Europe for the recovery of the Holy Land from the Mohammedans. The crusading spirit was aroused throughout Europe in 1095 by the preaching of the monk Peter the Hermit, who with Walter the Penniless set out in 1096 with an immense rabble, who were nearly all destroyed on the way. The first real crusade, under Godfrey of Bouillon, 1096-9, resulted in the capture of Jerusalem and the establishment of a Christian kingdom in the Holy Land; the second, 1147, preached by St. Bernard, was unsuccessful; the third, 1189-92, led by the prince Frederick Barbarossa of Germany, Richard the Lion-hearted of England, and Philip Augustus of France, failed to recover Jerusalem, which the Mussulmans had taken in 1187; the fourth, 1202-4, ended in the establishment of a Latin empire in Constantinople, under Count Baldwin of Flanders, one of its leaders; the fifth, 1228-9, under the emperor Frederick II, the sixth, 1248-50, under St. Louis (Louis IX. of France), and the seventh and last, 1270-71, also under St. Louis, were all unsuccessful. There were other expeditions called crusades, including one of boys, 1212, "the children's crusade," in which many thousands perished by shipwreck or were enslaved. The cost of the crusades and the loss of life in them were enormous, but they stimulated commerce and the interchange of ideas between the West and the East. The expeditions against the Albigenses under papal auspices, 1207-29, were also called crusades.

For the *crusade* preached through western Christendom, A. D. 1188, it was ordained that the English should wear a white cross; the French a red; the Flemish a green one. Quoted in *Rock's Church of our Fathers*, III. i. 446, note.

The *Crusades*, with all their drawbacks, were the trial feat of a new world, a reconstituted Christendom, striving after a better ideal than that of piracy and fraternal bloodshed. Stubbs, *Medieval and Modern Hist.*, p. 222.

With all their faults these nobles [of Cyprus] were bona fide *Crusaders*; men who, like the first champions, were ready to cast in their lot in a Promised Land, and not, like the later adventurers, anxious merely to get all they could out of it, to make their fortunes. **Crustacea** (krus-tā'shiā), *n. pl.* [*NL.*, neut. pl. of *crustaceus*, having a crust: see *crustaceous*. Cf. *L. crustata*, shell-fish: see *crustate*.] A class of *Arthropoda*; one of the prime divisions of articulated animals with articulated legs, as

distinguished from *Insecta*, *Myriapoda*, and *Arachnida* respectively. They are mostly aquatic arthropods with (generally) two pairs of antennae and numerous thoracic as well as (usually) abdominal articulated appendages, and breathing by means of branchiae. The body is covered with a hard chitinous test or crust, whence the name. It is segmented into head, thorax, and abdomen, the two former of which are more or less completely united into a cephalothorax, shielded with a continuous carapace; the abdomen is usually segmented and mobile, presenting the appearance of a tail. A typical segment or somite of the body consists, at least theoretically, of a dorsal portion or tergite of two pieces, a ventral portion or sternite, also of two pieces, an epimeron on each side above, and an episternum on each side below. The shell sends inward sundry hard processes or partitions called apodemes. The typical number of segments in the higher *Crustacea* is 21, actually or theoretically. The crustaceans shed their shells (exoskeletons), in some cases with extraordinary frequency, and they possess great reparatory powers in the reproduction of lost parts. Most of them pass through several larval stages, the best-marked of which are those of the forms called the nauplius, zoea, and megalopa. The crustaceans include all kinds of crabs and lobsters, shrimps, prawns, crawfish, etc., among the higher forms; and among the lower, a great variety of creatures known as sand-hoppers, beach-fleas, wood-lice, fish-lice, barnacles, etc. Leading types, in more technical terms, are the thoracotracan, polioptalmic, or stalk-eyed crustaceans, as crabs and crawfish; the eulophthalmic, or sessile-eyed crustaceans, as lepidopoda, amphipoda, and isopoda (all the foregoing being sometimes grouped together as malacostracous crustaceans); the entomostracous crustaceans, as the copepods, ostracodes, cladocerans, phyllopoda, etc., the trilobites and their related forms being often brought under this division; the epi-zoans, ichthyophthirians, or fish-lice; and finally, the cirripeds. Great as is the difference between extremes in any of these forms, they are closely related by connecting forms, and naturalists are by no means agreed upon the formal division of the class. The older divisions which have been made are now mostly superseded, and even the modern ones are seldom exactly terminous. A series of subclasses sometimes now adopted is: (1) *Cirripedia* or *Pectostraca*, with three or four orders; (2) *Epi-zoia* or *Ichthyophthiria*; (3) *Entomostraca*, with such orders as *Copepoda*, *Ostracoda*, *Cladocera*, *Phyllopoda*, *Xiphura*, *Trilobita*, *Eurypteria*; (4) *Eulophthalma*, with *Leptopoda*, *Amphipoda*, and *Isopoda*; (5) *Podophthalma*, with *Stomatopoda* and *Decapoda*; to which some add (6) *Podostomata*, often considered to be arachnidans. The fourth and fifth of these are often united as one subclass, *Malacostraca*. The trilobites with the eurypterygians and king-crabs sometimes constitute one prime division called *Gigantostomata*. Haeckel uses *Caridea* as a substitute for *Crustacea*.

[cap.] The Southern Cross, the most celebrated constellation of the southern heavens. It was erected into a constellation by Royer in 1679, but was often spoken of as a cross before; there even seems to be an obscure allusion to it in Dante. It is situated south of the western part of Centaurus, east of the keel of Argus. It is a small constellation of four chief stars, arranged in the form of a cross. Its brightest star, the southernmost, is of about the first magnitude; the eastern, half a magnitude fainter; the northern, of about the second magnitude; and the western, of the third magnitude and faint. The constellation owes its striking effect to its compression, for it subtends only about 6° from north to south and still less from east to west. It looks more like a kite than a cross. All four stars are white except the northernmost, which is of a clear orange-color. It contains a fifth star of the fourth magnitude, which is very red.

The theory of the cosmic origin of cryoonite does not appear as yet to have been generally admitted.

It is important as a source of the metal aluminium, and is also used for making soda and some kinds of glass. Cryolite has also been discovered at Minsk in the Ural mountains, and in small quantities in Colorado.—**Cryolite glass**, or *hot-cast porcelain*, a semi-transparent or milky-white glass, made of silica and cryolite with oxide of zinc, melted together. One form consists of two glass globes united by a tube. Water is poured into one globe and boiled to expel the air, and while boiling the apparatus is hermetically sealed. When cool, the pressure of the included vapor is reduced to that due to the temperature of the surrounding atmosphere. The empty globe is then surrounded by a freezing-mixture, the vapor is condensed, and rapid evaporation takes place from the other globe, which is soon frozen by the lowering of its temperature.

In chem. and mineral., a body which, by the operation of molecular attraction, has assumed a definite internal structure with the form of a regular solid inclosed by a certain number of plane surfaces arranged according to the laws of symmetry. The internal structure is exhibited in the cleavage, in the behavior of sections in polarized light, etc. The external form is discussed under *crystallography* (which see). Crystals are obtained in the laboratory either by fusing substances by heat and allowing them gradually to cool, or by dissolving them in a fluid and then abstracting the latter by slow evaporation; also by the direct condensation of a vapor produced by sublimation, as in the case of arsenious oxide, in the same way that snow-crystals are formed directly from water-vapor in the upper atmosphere. The name was first applied to the transparent varieties of quartz, specifically called *rock-crystal*.

There was a sea of glass like unto crystal. Rev. iv. 6.

The term *crystal* is now applied to all symmetrical solid shapes assumed spontaneously by lifeless matter. Huxley, *Physiology*, p. 59.

[Venus is here used as a symbol of copper (with allusion to Cyprus).]—**Distorted crystal**, a crystal whose form varies more or less from the ideal geometrical solid which its symmetry requires. This is due to the extension of certain faces at the expense of others during the growth of the crystal, but in general without altering the interfacial angles. In fact, all crystals are more or less distorted.—**Embedded crystals**, crystals enveloped within the mass of a rock or other mineral.—**Gemulated crystal**, a twin or compound crystal, consisting of two or more parts bent at an angle to one another, as is common with the mineral rutile.—**Iceland crystal**, a variety of calcite or crystallized calcium carbonate brought from Iceland, remarkable for its transparency.—**Implanted crystals**, crystals which pro-

The process by which the molecules of a substance which is in the state of a liquid (or vapor) unite in regular (crystalline) form when it solidifies by cooling or evaporation. If the process is slow and undisturbed, the molecules assume a regular arrangement, each substance taking a determinate form according to its natural laws; but if the process is rapid or disturbed, the external form may be more or less irregular. An amorphous solid body may also undergo partial crystallization by a molecular rearrangement, giving it a more or less complete crystalline structure, as, for instance, in the iron of a railroad-bridge after long use. See *crystallography*.

2. The mass or body formed by the process of crystallizing.

Also spelled *crystallisation*. **Alternate crystallization**, a species of crystallization which takes place when several crystallizable substances having little affinity for one another are present in the same solution. The substance which is largest in quantity and least soluble crystallizes first, in part; the least soluble substance next in quantity then begins to crystallize; and thus different substances, as salts, are often deposited in successive layers from the same solution.—**Water of crystallization**, water which is held by certain salts as a part of their crystalline structure, but is not inherent in the molecule. Thus, common sodium carbonate, when it crystallizes from a solution, contains for each molecule of sodium carbonate ten molecules of water. This is so weakly held that it escapes as vapor in dry air at ordinary temperatures. The crystalline form of the salt often depends on the number of molecules of water which the crystals contain. Water of crystallization differs from combined water in that it does not belong to the molecular structure, but only to the crystalline structure, of the substance.

**crystallize** (kris'ta-liz), v.; pret. and pp. *crystallized*, ppr. *crystallizing*. **crystallography** (kris'ta-lō-grā-fī), *n.* [= *F. cristallographie* = *Sp. cristalografia* = *Pg. cristallographia* = *It. cristallografia* = *D. kristallografie* = *Dan. krystallografi*, *< Gr. κρυσταλλος*, crystal, + *-γραφία*, *< γράφειν*, write.] 1. The science of the process of crystallization, and of the forms and structure of crystals. The following are the generally adopted systems of crystallization, based upon the degree of symmetry which characterizes the different forms, but defined according to the length and inclination of the assumed axes: (a) the *isometric*, characterized by three rectangular axes, all of equal length; (b) the *tetragonal*, by three rectangular axes, two of which are of equal length; (c) the *hexagonal* (and *rhomboidal*), by four axes, three of equal length, in the same plane, and inclined to one another at an angle of 60°, the fourth of different length, and at right angles to the plane of the other three; (d) the *orthorhombic*, by three rectangular axes of unequal length; (e) the *monoclinic*, by three axes, two at right angles to each other, and the third perpendicular to one and oblique to the other; and (f) the *triclinic*, by three axes, all oblique to one another. (See these names.) Instead of *isometric*, the terms *monometric*, *cubic*, and *regular* are sometimes used; instead of *tetragonal*, *dimetric*; instead of *orthorhombic*, *trimetric* or *rhombic*; instead of *monoclinic*, *monosymmetric* or *oblique*; and instead of *triclinic*, *asymmetric* or *anorthic*. The *isometric*, *tetragonal*, and *orthorhombic* systems are sometimes spoken of collectively as *orthometric*, and the *monoclinic* and *triclinic* as *clinometric*; similarly, the *tetragonal* and *hexagonal* systems have been called *isodimetric*. The study of crystallography is of great importance to the chemist and mineralogist, as the nature of many substances may be ascertained from an inspection of the forms of their crystals.

2. A discourse or treatise on crystals and crystallization.

**crystalloid** (kris'ta-lōid), *a.* and *n.* [= *F. cristalloide* = *It. cristalloide*, *< Gr. κρυσταλλοειδής*, *< κρυσταλλος*, crystal, + *εἶδος*, shape.] 1. *a.* Resembling a crystal.

II. *n.* 1. The name given by Professor Graham to a class of bodies which have the power,

when in solution, of passing easily through membranes, as parchment-paper, and which he found to be of a crystalline character. Metallic salts and organic bodies, as sugar, morphia, and oxalic acid, are crystalloids. They are the opposite of *colloids*, which have not this permeating power. See *colloid*.

The relatively small-atomed *crystalloids* have immensely greater diffusive power than the relatively large-atomed colloids. *H. Spencer, Prin. of Biol.*, § 7.

2. A protein crystal—that is, a granule of protein in the form of a crystal, differing from an actual crystal in the inconstancy of its angles and in its property of swelling when immersed in water. Such crystalloids are of various forms and usually colorless.

**crystalloidal** (kris'ta-lōi'dal), *a.* [*< crystalloid + -al.*] Of or pertaining to or of the nature of a crystalloid.

The operator first muttered over the crystal (a beryl was preferred) certain formulas of prayer, and then gave it into the hands of a young man or a virgin, who thereupon, by oral communication from spirits in the crystal, or by written characters seen in it, was supposed to receive the information desired.

**crystallogometry** (kris'ta-lōm'e-trī), *n.* [= *F. cristallométrie*, *< Gr. κρυσταλλος*, crystal, + *-μετρία*, *< μέτρον*, a measure.] The art or process of measuring the forms of crystals.

*Crystallogometry* was early recognized as an authorized test of the difference of the substances which nearly resembled each other. *Whewell*.

They are remarkable for forming in the ground a habitation consisting of a long cylindrical tube, protected at the top by a circular door, which is connected to the tube by a hinge. The lid is made of alternate layers of earth and web, and when shut can scarcely be distinguished from the surrounding soil.

Are we to accept this view of Lankester and to consider the gill as we find it in most *ctenobranchs* derived from a *ctenidium* by modification, or shall we regard the common form of *ctenobranch* gill as the most primitive? *Biol. Lab. of Johns Hopkins*, III. 44.

They have two tentacles and two eyes, the latter often pediculate. The sexes are separate, and the external organs of generation are distinct. There are both fresh- and salt-water species. The whelk is the best-known member of the family. The *Ctenobranchiata* are now regarded as a suborder of *prosobranchiate* gastropods, containing upward of 20 families. They are exceptional among the *hystriomorph* animals in not having four back teeth above and below on each side. In *Ctenodactylus* the molars are three in each half jaw above and below, there being no premolars; and in *Pectinator*, the only other genus, these teeth are minute. The *Ctenodactylinae* have some relationship with the jerboas, though totally different in appearance. They are confined to Africa.

They are pellucid gelatinous marine organisms, are radially symmetrical, and swim by means of eight meridional ciliated bands, rows of pectinations or ctenophores, whence the name. In form they are spheroidal or cylindrical, rarely cestoid. They possess an esophageal tube and a gastrovacular system, and often two lateral retractile tentacles, but no corallum. They are hermaphrodite, reproduction being by ova discharged through the mouth. A localized sense-organ called a ctenocyst is present. True nematocysts are usually wanting, but are represented by organs known as fixing or prehensile cells, the base of which is a spirally coiled thread, while the free extremity is enlarged, projecting, and glutinous. The *Ctenophora* are divided by some into four orders, *Lobata*, *Tentaculata*, *Saccata*, and *Eurytomata*; by others directly into a number of families. Putte thou elde clothes . . . vndur the cubit of thin hondis (translation of Latin *sub cubito*). *Wyclif, Jer. xxxviii. 12* (Purv.).

(b) The inner bone of the forearm; the ulna. —2. A linear unit derived from the length of the forearm. The natural cubit used for measuring cloth was probably originally the length from the end of the thumb-nail to the elbow, though no cubit so short is known. The royal Egyptian cubit is, of all units of measure or weight, that one whose use can be traced back in history the furthest; for it was employed in the construction of the pyramids of Gizeh, perhaps 3600 B. C. From a number of Egyptian measuring-sticks found in the tombs, this cubit is ascertained to be equal to 20.64 English inches, or 524 millimeters. It was divided into seven palms, instead of six as the ordinary cubit was; and this was probably owing to measurements along walls with the forearm having been made by placing the hand behind the elbow and leaving it on the wall until the arm was laid down again. The Egyptian and Roman are the only ancient cubits of importance whose lengths are undisputed. The Roman cubit was  $1\frac{1}{2}$  Roman feet, or 17.4 English inches. Two cubits are mentioned in the Bible, for Ezekiel speaks of a cubit which is a cubit and a hand-breadth. The shorter of these cubits was probably that which in Deuteronomy is called the cubit of a man; the longer one, that which in Chronicles is called the cubit after the first measure—that is, the most ancient cubit. Julian of Ascalon speaks of two cubits in the ratio of 23 to 25. But we have no accurate knowledge of the lengths of the Hebrew cubits, since the cubit of the temple is estimated variously by high authorities, as from 19 to 26 inches. There are many cubits, ancient and modern, of widely different values.

And see schulle undirtonde, that the Cros of oure Lord was eyght Cubytes long, and the overthwart piece was of lengthe thre Cubytes and an half.

When the complete brassart was introduced, toward the close of the fourteenth century, the cubitière formed a part of this, and was regularly articulated; but the old cup-shaped form or some modification of it was retained by those who could not afford the expense of the brassart of plate. MHG. *gouch*, G. *gauch* = AS. *gedc* = Icel. *gaurk*, > E. *gowk*, a cuckoo: see *gowk*) and in many other tongues, in various forms of the type *kuk*, being a direct imitation of the characteristic cry of the bird. A similar imitation occurs also in *coo*, *cook*<sup>2</sup>, *cock*<sup>1</sup>, *caw*, etc. (see these words). The forms, being imitative, do not conform closely to the rules of historical development. In early superstitions the cuckoo was regarded as of evil omen, and enters into various imprecations and proverbs as an embodiment of the devil. It was also a term of reproach or contempt equivalent to *fool* (cf. *gowk*, in similar use), and with reference to its habit of laying its eggs in other birds' nests is the subject of endless allusion in early literature: see *cuckold*<sup>1</sup>.] 1. A bird of the family *Cuculidae*, and especially of the subfamily *Cuculinae* or genus *Cuculus*: so called from its characteristic note. The common cuckoo of Europe is *Cuculus canorus*, about 14 inches long, with zygodactyl feet, broad rounded tail, curved

bill, and ashy plumage varied with black and white. It is notorious for its parasitism, having the habit common to many birds of the family of depositing its eggs in the nests of other birds, chiefly smaller than itself, and causing its young to be reared by the foster-parents—a condition generally entailing the destruction of their own progeny. The remarkable cries which have given the bird imitative names in many languages are the love-notes, uttered only during the mating season. The species of cuckoos are very numerous, and are found in most parts of the world; they are not all parasitic. There are several subfamilies of *Cuculinae*, and many genera. (See *Cuculinae*.) The American or tree-cuckoos are arboreal, not parasitic, and are confined to America; they are also called hook-billed cuckoos, a term not of special pertinence. The ground-cuckoos are American birds of terrestrial habits. The created cuckoos are old-world forms, as are also the coucals, lark-heeled or spur-heeled cuckoos, also called pheasant-cuckoos.

The cuckoo builds not for himself. *Shak.*, A. and C., II. 6.

are probably of American origin and were all cultivated in America long before its discovery by Columbus. They have developed many very different forms. *C. Pepo* and its varieties yield the pumpkin, the warty, longneck, and crookneck squashes and vegetable marrow, and the egg- or orange-gourd. *C. maxima* yields the various varieties of winter squash, often of great size, the turban-squash, etc. *C. moschata* is the source of the musky, China, or Barbary squash.

An acrid principle pervades the family; when this principle is greatly diffused the fruits are edible, often delicious, but when concentrated, as in the colocynth and bryony, they are dangerous or actively poisonous. The family includes 90 genera and about 660 species, the most useful genera being *Cucumis* (the cucumber and muskmelon), *Cucurbita* (the pumpkin and squash), *Citrullus* (the watermelon and colocynth), and *Lagenaria* (the gourd). 2. (a) A distinct terminal part of a sleeve at the wrist, intended for embellishment. The cuff was made originally by turning back the sleeve itself and showing either the same material as that of the sleeve or a different material used as a lining. In the fifteenth century a prominent part of the dress was the large cuff, which could be turned down so as to cover the hand to the finger-tips, and when turned back reached nearly to the elbow. In modern times the coat-sleeve has been sometimes made with a cuff which can be turned down over the hand, though not intended to be so used, and sometimes with a semblance of a cuff, indicated by braid and buttons, or by a facing of velvet or other material, or merely by a line or lines of stitching around the sleeve. (b) A band of linen, lace, or the like, taking the place of, and covering a part of the sleeve in the same manner as, the turned-up cuff. In the seventeenth century such cuffs, worn by ladies, were often extremely rich, of expensive lace, and reached nearly to the elbow. Plain linen cuffs were also worn about 1640, and were especially affected by the Puritans in England. When the plain linen wristband worn attached to the shirt by men first came into use, in the early part of the nineteenth century, it was commonly turned back over the sleeve, and was a true cuff. (c) In recent times, a separate band of linen or other material worn about the wrist and appearing below the end of the sleeve. As worn by men, it is buttoned to the wristband of the shirt.—3. **Gelatin culture**, a growth of bacteria in a medium made of the consistence of jelly by means of gelatin.—*Pure culture*, in *bacteriology*, a growth of one kind of bacteria free from admixture of other varieties.—*Solid culture*, a culture of bacteria, etc., for which the medium is a solid at ordinary temperatures, usually gelatin or a preparation, such as agar-agar, made from algae.—*Test-tube culture*, a growth of bacteria in a test-tube.—*Syn.* 4-6. *Refinement*, *Cultivation*, *Culture*. Each of these words may represent a process or the result of that process. Only *refinement* can, when unqualified, represent a process or result carried too far. *Refinement* is properly most negative, representing a freeing from what is gross, coarse, rude, and the like, or a bringing of one out of a similar condition in which he is supposed to have been at the start. *Cultivation* and *culture* represent the person or the better part of him as made to grow by long-continued and thorough work. *Refinement* and *cultivation*, as thus representing the more negative and the more positive aspects of the improvement of man, were much more common until within thirty years; since then *culture* has largely supplanted *cultivation*: this change, coming when great attention was concentrating about the subject of the development of all the departments of the nature of man, produced a great enlargement of the definition of *culture*, for a time the improvement and gratification of taste being magnified in undue proportion by some, and by others the mere acquisition of knowledge. The word is now applied to the improvement of the whole man, bodily, mentally, and spiritually, although bodily training is not prominent unless specially mentioned; the moral and the spiritual are jealously included. *Culture* may be used of the state of society as well as of the man; *refinement* and *cultivation* refer primarily to the state of the individual. As referring to either, *culture* in its broadest sense may be called the highest phase of civilization.

What do we mean by this fine word *Culture*, so much in vogue at present? What the Greeks naturally expressed by their *paideia*, the Romans by *humanitas*, we less happily try to express by the more artificial word *Culture*. . . . When applied to the human being, it means, I suppose, the "educing or drawing forth [of] all that is potentially in a man," the training [of] all the energies and capacities of his being to the highest pitch, and directing them to their true ends.

= *Syn. 4*. *Cunning*, *Artful*, *Sly*, *Subtle*, *Shrewd*, *Tricky*, *Adroit*, *Wily*, *Crafty*, *Intriguing*, sharp, foxy. All these words suggest something underhand or deceptive. *Cunning*, literally knowing, and especially knowing how, now implies a disposition to compass one's ends by concealment; hence we speak of a fox-like *cunning*. *Artful* indicates greater ingenuity and ability, the latter, however, being of a low kind. *Sly* is the same as *cunning*, except that it is more vulgar and implies less ability. ("A col-fox, full of sleigh iniquité." Chaucer, *Nun's Priest's Tale*, l. 396.) ("Envy works in a sly, imperceptible manner." Watts.) *Subtle* implies concealment, like *cunning*, but also a marked ability and the power to work out one's plans without being suspected; hence, while *cunning* is applicable to brutes, *subtle* is too high a word for that, except by figurative use. The rabbit is *cunning* enough to hide from the dog; *Mephistopheles* is *subtle*. (For the favorable meanings of *subtle*, see *astute*. For the good senses of *shrewd*, see *acute*.) In its unfavorable aspects *shrewd* implies a penetration and judgment that are somewhat narrow and worldly-wise, too much so to deserve the name of sagacity or wisdom. (See *astute*.) *Tricky* is especially a word of action; it expresses the character and conduct of one who gets the confidence of others only to abuse it by acts of selfishness, especially cheating. *Adroit*, in a bad sense, expresses a ready and skilful use of trickery, or facility in performing and escaping detection of reprehensible acts. (See *adroit*.) *Wily* is appropriate where a person is viewed as an opponent in real or figurative warfare, against whom wiles or stratagems are employed: a *wily* adversary is one who is full of such devices; a *wily* politician is one who is notably given to advancing party interests by leading the opposite side to commit blunders, etc. A *crafty* man has less ability than a *subtle* man, and works more by deception or knavery than the *shrewd* man; he is more active than the *cunning* man, and more steadily active than the *sly* man; he is on the moral level of the *trickish* man. *Intriguing* is applied where the plots are secret arrangements made with others, perhaps against a third party, and especially of a complicated character.

**cunning**<sup>2</sup> (kun'ing), *n.* [*< ME. cunnyng, coning, cunying*, var. of *cony*, *conig*, etc., whence mod. E. *cony*, *coney*, *q. v.* The form *cunning* remains in mod. use only as applied to the lamprey, and in the proper names *Cunningham*, *Conyngnam*,

See *controller*, 2.—Decimal currency, a system of money the divisions or denominations of which proceed from its lowest unit of reckoning by ten or its multiples, or aliquot parts thereof, as the cent, dime, dollar, quarter-dollar, etc., of the United States and Canada.—Fractional currency, coins or paper money of a smaller denomination than the monetary unit; in the United States, half-dollars, quarters, dimes, and 5-cent, 3-cent, 2-cent, and 1-cent pieces. Fractional currency in paper has been largely used in several European countries, and is a part of the monetary system of Japan. The former received the name of *shinplasters*. (See *shinplaster*.) The smallest denomination of the first is \$20, and of the last \$1.—Postage currency. See *fractional currency*, above.—The currency principle, a phrase first employed in English banking to express the mode of issuing notes by the Bank of England. II. n. 1. A flowing; a flow; a stream; a passing by a continuous flux: used of fluids, as water, air, etc., or of supposed fluids, as electricity.

The Pontick sea, Whose icy current and compulsive course Ne'er keeps retiring ebb. Shak., Othello, iii. 2.

2. Specifically, a portion of a large body of water or of air moving in a certain direction: as, ocean-currents. The set of a current is that point of the compass toward which the waters run; the drift of a current is the rate at which it runs. Ocean currents are often divided into *drifts* and *streams*: the former are broad, shallow, and slow-moving; the latter are narrow, deep, and fast-moving (up to 80 miles or more a day), and gain their unusual velocity and depth from constriction in a strait, as in the Strait of Florida, where the Gulf Stream well deserves its name; or from constriction between the winds and the land, as south of Japan, where the Kuroshio resembles the Gulf Stream. Much of the North Atlantic current that is popularly known as the Gulf Stream is properly a drift. In the larger ocean areas, such as North Atlantic, Indian, etc., the currents unite or circulate in such a way as to form a vast eddy, turning clockwise in the North Atlantic and North Pacific, but counter-clockwise in the South Atlantic, South Pacific, and Indian oceans. A counter-current is a smaller ocean current running against the course of a neighboring current: applied especially to the narrow westward currents between the eastward equatorial currents. See *ocean*.

3. Course in general; progressive movement or passage; connected series: as, the current of time.—4. General or main course, general tendency: as, the current of opinion.—5. The amount of depression given to a roof to cause the water which falls upon it to flow in a given direction.—Alternating current, an electric current which reverses its direction in equal intervals of time, so that it has the same intensity in the one direction as in the other.—A make-and-break current, an intermittent electric current in a circuit which is rapidly made and broken, as by the vibrations of a sonorous disk.—Amperian currents. See *amperian*.—Atmospheric currents, movements of the air constituting winds, caused by regular or fortuitous disturbances of the atmosphere.—Cable-current, when a submarine cable is broken, a steady current through it, produced by the exposed copper wire forming a battery with the iron sheathing.—Current-sailing. See *sailing*.—Currents of action, the electrical currents developed in a nerve or muscle by stimulation.—Currents of rest, the electrical currents which pass on connecting different points of an unstimulated piece of nerve or muscle.—Earth-current, a current flowing through a wire the extremities of which are grounded at points on the earth differing in electric potential. The earth-current is due to this difference, which is generally temporary and often large. If the earth-plates of a circuit are of different metals, as copper and zinc, an earth-battery current is set up which is feeble and tolerably constant.—Electric current, the passage of electricity through a conductor, as from one pole of a voltaic battery to the other—for example, in the telegraph. (See *electricity*.) A current is said to be intermittent when repeatedly interrupted, as by the breaking and making of the circuit, pulsatory when characterized by sudden changes of intensity, and undulatory when the intensity varies according to the same law as that governing the velocity of the air-particles in a sound-wave.—Faradaic current. See *faradaic*.—Galvanic current, an electric current generated by a galvanic battery, as distinguished from an induced current, or a current produced by a dynamo or other electrical machine.—Induced current. See *induction*.—Interrupted current, an electric current the flow of which is completely arrested at frequently recurring intervals. It is generally produced by means of a rapid vibrating armature, a rotating disk, or a similar device.—Inverse current, the current induced in the secondary coil of an induction apparatus when the circuit of the primary is closed. It is contrary to the primary current in direction.—Muscle-current, the electrical current which passes on connecting different points of a muscle.—Polyphase current, a system combining two or more alternating currents differing in phase.—Primary current, the electric current which passes through the primary coil of an induction apparatus, in the secondary

coil of which the secondary or induced current is produced. — **Reverse current**, an electric current opposite in direction to the normal current. = **Syn.** 1 and 2. *Eddy*, etc. See *stream*.

**cursive** (kér'siv), *a. and n.* [= *F. cursif* = *Sp. Pg. cursivo* = *It. corsivo*, < *ML. cursivus*, running (of writing), < *L. cursus*, a running, a course, < *currere*, run: see *current*.] I. *a.* Running; flowing, as writing or manuscript in which the letters are joined one to another, and are formed rapidly without raising the pen, pencil, or stylus; specifically, in *paleography*, modified from the capital or uncial form, so as to assume a form analogous to that used in modern running hand: as, the *cursive style*; *cursive letters*; *cursive manuscripts*. Greek cursive writing is found in papyri dating back to about 160 B.C., at first very similar to the lapidary and uncial characters of the same period, but gradually becoming more rounded in form and negligent in style. The epithet *cursive* is, however, most frequently applied to the later cursive or minuscule writing from the ninth century on. (See *minuscule*.) The beginning of a Latin cursive character is seen in some waxed tablets discovered in 1875 in the house of L. Caecilius Jucundus at Pompeii. Forms similar to these also occur in the dipinti and graffiti (characters painted on or incised in walls, earthenware, etc.) of the same place or period. The ancient Latin cursive character known to us in manuscripts from the fourth century on is, however, considerably different from this. In medieval manuscripts the cursive hand was employed from the Merovingian epoch, often in combination with the other contemporary styles; but from the ninth century it was replaced for all careful work by the so-called Caroline and Gothic characters, and continued in use up to the invention of printing only in degenerated form and for writings of small importance or hasty execution. (See *manuscript*.)

In the earliest examples of *cursive* writing we find the uncial character in use, and, as has been already remarked, many of the specimens fluctuate between the more formal or set book-hand and the *cursive*.

*Encyc. Brit., XVIII. 149.*

II. *n.* 1. A cursive letter or character: as, a manuscript written in *cursive*.

**curve** (kérv), *a.* and *n.* [In earlier use *curb*, < ME. *courbe*, < OF. *courbe*, *corbe* (see *curb*), F. *courbe* = Pr. *corb* = Sp. Pg. *it. curvo*, < L. *curvus*, bent, curved, = Oulg. *kriwá*, bent, = Lith. *kreivas*, crooked, akin to Gr. *κῡρός*, bent, and prob. to *κῡρος*, *κῡρος*, L. *circus*, a ring, circle: see *circle*.] **I. a.** Bending; crooked; curved.

A curve line is that which is neither a straight line nor composed of straight lines. *Ogilvie*.

**II. n.** 1. A continuous bending; a flexure without angles; usually, as a concrete noun, a one-way geometrical locus which may be conceived as described by a point moving along a line round which as axis turns a plane, while the line rotates in the plane round the point. The curve is at the same time the envelop of the plane and of the line. Geometers understand a curve as something capable of being defined by an equation or equations, or otherwise described in general terms. It may thus have nodes, cusps, and other singularities, but must not be broken in a way which cannot be precisely defined without the use of special numbers. Curves are often employed in physics and statistics to represent graphically the changes in value of certain physical or statistical quantities: as, the energy curve of the solar spectrum; the isothermal line or curve; the curve of population.

Nor pastoral rivulet that swerves  
To left and right thro' meadowy curves.

An *in curve* is one that deflects from the straight line toward the batter; an *out curve*, away from the batter. A drop deflects downward, and a *rise* or *up curve* upward. — **Adiabatic curve.** See *adiabatic*. — **Algebraic curve,** a curve whose equations in linear coordinates contain only algebraic functions of the coordinates. — **Anaclastic curves, anallagmatic curves.** See the adjectives. — **Anticlinal and synclinal curves, in geol.,** terms applied to the elevations and depressions of undulating surfaces of strata. A cubic curve in a plane is one which is cut by every line in the plane in three points, real or imagi-

nary. Such curves are of three genera: nodal cubics, which have either a crunode or an acnode; cuspidal cubics, which have a cusp; and non-singular cubics, which are bicursal, though one branch may be imaginary. — **Curve coordinates.** See *coordinate*. — **Curve of beauty,** a gentle curve of double or contrary flexure, in which it has been sought to trace the foundation of all beauty of form. Also called *line of beauty*. — **Curve of curvature,** a curve drawn upon a surface in such a manner that at every point normals to the surface at consecutive points of the curve intersect one another. — **Curve of double curvature,** a curve not contained in one plane. — **Curve of elastic resistance, in gun.,** a curve whose ordinates give the elastic resistance of a built-up gun at the different points along the bore. — **Curve of equal or equable approach.** See *approach*. — **Curve of probability,** a curve whose equation is

$$y = \frac{a}{\sqrt{\pi}} e^{-x^2},$$

representing the probabilities of different numbers of recurrences of an event. — **Curve of pursuit,** the curve described by a point representing a dog which runs with constant velocity toward another point representing a hare, this second point also moving, generally in a straight line, with constant velocity. After the dog passes the hare, he runs away from it according to the same law. — **Curve of sines, cosines, tangents, secants, etc.,** curves in which the abscissa is proportional to the angle, and the ordinate to a trigonometric function of the angle. — **Cuspidal curve,** a curve on a surface along which the surface so touches itself that on cutting the surface by an arbitrary plane at every intersection of this plane with the cuspidal curve the intersection of the plane with the surface has a cusp. — **Deficiency of an algebraic curve,** the number by which the number of its double points — nodes and cusps — falls short of the highest number which a curve of the same order can have. — **Dianodal curve.** See *dianodal*. — **Distribution of a curve, in geom.,** twice the number of double points increased by three times the number of cusps. — **Elastic curve,** the figure assumed by a thin elastic plate acted upon by a force and a couple. — **Equation to a curve.** See *equation*. — **Equitangential curve,** a curve upon whose tangents a fixed line (called the *directrix*) intercepts equal distances from the points of tangency. — **Exponential curve.** See *exponential*. — **Family of curves,** a singly infinite series of curves differing from one another only by the different values assumed by one constant. — **Flexure of a curve, in math.,** the bending of the curve toward or from a straight line. — **Focal curve, the locus of foci of a surface.** — **Foliate curve, Newton's 41st species of cubic curves,** a plane cubic having a crunode and a point of inflection at infinity, the inflectional tangent being an ordinary line. The form of the curve traced out by the point of light depends upon the difference of pitch between the two forks, and also upon the difference of phase. — **Loxodromic curve.** See *loxodromic*. — **Magnetic curve.** See *magnetic*. — **Mechanical curve,** a curve of such a nature that the relation between the abscissa and the ordinate cannot be expressed by an algebraic equation. Such curves are now generally called *transcendental curves*: opposed to *algebraic curve*. — **Order of an algebraic curve,** the number of points, real or imaginary, in which it cuts every plane (or every line in that plane). — **Organic description of curves, in geom.,** the description of curves on a plane by means of instruments. — **Periodic curve,** a curve which represents a periodic function. — **Plane curve,** a curve lying in a plane. — **Quartic curve,** a curve of the fourth order. — **Radical curve,** a spiral having several branches through the origin. — **Range curve,** a curve employed to determine the approximate ranges for different angles of elevation of a projectile fired from a given piece with a given charge of powder. It is constructed by tracing a line through the points of intersection of the ordinates and abscissas representing respectively the angles of elevation given and the corresponding ranges obtained from practice. It gives a rapid method for interpolating intermediate ranges. The common use or practice, either of an individual or of a community, but especially of the latter; habitual repetition of the same act or procedure; established manner or way.

We are all living according to *custom*; we do as other people do, and shrink from an act of our own.

2. In *law*, collectively, the settled habitudes of a community, such as are and have been for an indefinite time past generally recognized in it as the standards of what is just and right; ancient and general usage having the force of law. Some writers use the word without qualification, as meaning only *general customs*—that is, such as are prevalent throughout the nation; and some as meaning only *local* or *particular customs*, such as obtain only in a particular class, vocation, or place. In modern use, *custom* is more appropriate to immemorial habitudes, either general or characteristic of a particular district and having legal force, and *usage* to the habitudes of a particular vocation or trade. In the history of France the term *custom* is applied specifically to numerous systems of ancient usage which were judicially recognized as binding upon their respective communities before the revolution of 1789, or until the promulgation of the Code Napoléon: as, the *custom* of Normandy, of Brittany, of Orleans, etc. There were 60 general customs (each extending over a whole province) and 166 particular customs (those of cities, bishoprics, etc.) reduced to writing. The *custom* of Paris was established by the French as the law of Canada, and many of its provisions were embodied in the Code Napoléon.

3. The buying of goods or supplying of one's current needs; the practice of having recourse to some particular place, shop, manufactory, house of entertainment, etc., for the purpose of purchasing or giving orders.

*Capt. John Smith, True Travels, II. 80.*

4. Toll, tax, or duty; in the plural, specifically, the duties imposed by law on merchandise imported or exported. In the United States customs are by the Constitution confined to duties on imports (on which alone they are now levied in European countries generally), and are imposed by act of Congress. They have constituted more than half the receipts of the national government. Their management is intrusted to an officer of the Treasury Department called the Commissioner of Customs. See *tariff*.

Custom, Habit, Usage, Manner, Practice, Fashion, rule, wont.** *Custom* implies continued volition, the choice to keep doing what one has done; as compared with *manner* and *fashion*, it implies a good deal of permanence. *Habit* is a custom continued so steadily as to develop a tendency or inclination, physical or moral, to keep it up: as, the *habit* of early rising; the *habit* of smoking. *Habit* and *practice* apply more often to the acts of an individual; *fashion* and *usage* more often to many; the others indifferently to one or more. *Manner* ranges in meaning from *custom* to *habit*: as, it was the *manner* of the country. *Practice* is nearly equivalent to *custom*, but is somewhat more emphatically an act. *Fashion* is applied to those customs which go by caprice or fancy, with little basis in reason; it especially applies to trifling things, and those things which have little permanence: as, it is the *fashion* of the time; hence its application to the constantly changing styles of dress.

III *customs* by degrees to *habits* rise,  
III *habits* soon become exalted vice.

cephalopodous mollusk, with a depressed body, inclosed in a sac. The shorter arms or feet, eight in number, covered with four rows of raised disks or suckers, are arranged around the mouth, and from the midst of them extend two long tentacles, also furnished with disks. These members the animal uses in walking, for attaching itself to objects, and for seizing its prey. In a sac or funnel exists below the head and leads from the gills, through which the water admitted to these organs is expelled; and the creature, by ejecting the water with force, can dart backward with amazing velocity. In a sac on the back of the mantle there is a light, porous, calcareous shell formed of thin plates; this is the cuttlebone or sepiot, corresponding to the calamary or pen of the squids. bryo of certain compound ascidians, as of those of the genus *Pyrosoma*, serving only to found a colony by gemmation. See the extract.

The result [of the process of yolk-division] is the formation of an elongated flattened blastoderm, which occupies one pole of the egg, and is converted into what I termed the *cyathozooid*, which is . . . a sort of rudimentary ascidian. From this, a prolongation or stolon is given off, which becomes divided by lateral constrictions into four portions, each of which gives rise to a complete ascidozooid. As these increase in size, they coil themselves round the *cyathozooid*, with their oral openings outwards and their cloacal openings inwards, and thus lay the foundation of a new ascidiarium. The *cyathozooid* eventually disappears, and its place is occupied by the central cloacal cavity. *Huxley, Anat. Invert.*, p. 522.

**cyclamin** (sik'la-min), *n.* [*Cyclam(en)* + *-in*.] A vegetable principle found in the root of species of *Cyclamen*. It is white, amorphous, or in minute crystals, and has a bitter, acrid taste.

**cyclamon** (sik'la-mon), *n.* [*Cyclam(en)* + *-on*.] In *ceram*., a purplish-red tint of modern introduction.

**Cyclanthus** (sik-lan'thus), *n.* [NL., < Gr. *κύκλος*, a circle, + *άνθος*, a flower.] A small genus of palm-like plants, type of the family *Cyclanthaceae*, which is allied to the *Pandanaceae* and includes five other genera. The forty-four species inhabit tropical America. They have fan-shaped leaves, and unisexual flowers arranged in spiral bands around the spadix.

Inflorescence and Leaf of *Cyclanthus bipartitus*.

**Cyclarhis** (sik'la-ris), *n.* [NL. There are some 10 species, ranging from Mexico to Paraguay.

**cyclarthrodial** (sik-lār-thrō'di-āl), *a.* [*Cyclarthrodia*, a circle, + *άρθρῳδία*, a particular kind of articulation, < *άρθρῶδης*, articulated; see *arthrodia*.] Having the character of a rotatory diarthrosis or lateral ginglymus; of or pertaining to a cyclarthrosis: as, *cyclarthrodial* articulation; *cyclarthrodial* movement.

In the former case a circle represented by the head of the bone turns through nearly 180° upon its own center, a segment of its circumference gliding in the lesser sigmoid cavity of the ulna. In the atlaxoid cyclarthrosis a ring swings back and forth upon a pivot at one point inside the circumference. Also called *rotatory diarthrosis* and *lateral ginglymus*.

**cyclas** (sik'las), *n.* [L., < Gr. *κυκλάς*, prop. adj., round (see *icthys*, garment), < *κύκλος*, round. Cf. *ciclaton*.] 1. An upper tunic of ornamental character worn by women under the Roman empire, and assumed by some emperors considered effeminate, as Caligula. It was made of fine material, and had its name from the border embroidered in purple and gold which surrounded it at the bottom.

2. An outer garment similar to the surcoat, apparently circular in form, worn in the fourteenth century, especially by women. When worn by knights over their armor, it was longer behind than before, and not very close-fitting; in this use it preceded the *jupon*.

This . . . *cyclas* was in fashion . . . only in the early half of the fourteenth century, and the effigies . . . with it are far from numerous.

Blotz, *Archæol. Jour.*, XXXV. 250.

E. *cylinder*, q. v.).] 1. An imaginary circle or orbit in the heavens.

The *cycle* of a change sublime  
Still sweeping through.

Whittier, *The Reformer*.

Things exist just so long as conditions exist, whether that be a moment or a *cycle*.

G. H. Lewes, *Probs. of Life and Mind*, 1st ser., VI. ii. § 10.

4. Any round of operations or events; a series which returns upon itself; specifically, in *physics*, a series of operations by which a substance is finally brought back to the initial state.—5. In *literature*, the aggregate of legendary or traditional matter accumulated round some mythical or heroic event or character, as the siege of Troy and the Argonautic expedition of antiquity, or the Round Table, the Cid, and the Nibelungs of medieval times, and embodied in epic or narrative poetry or in romantic prose narrative.

Their superstition has more of interior belief and less of ornamental machinery than those to which Amadis de Gaul and other heroes of the later *cycles* of romance furnished a model. *Hallam*, *Introduct. Lit. of Europe*, I. ii. § 57.

It is a well-known fact that many of the most popular traditional ballads, such as those of the Arthurian *cycle*, "Hynd Horn," and others, were simply abridgments of older metrical romances. *N. and Q.*, 7th ser., II. 421.

6. In *bot.*: (a) In the theory of spiral leaf-arrangement, a complete turn of the spire which is assumed to exist. (b) A closed circle or whorl of leaves.—7. In *corals*, a set of septa of equal length. See *septum*.

**Carnot's cycle**, the succession of operations undergone by the substance in the interior of Carnot's ideal engine: namely, the piston is first forced down without the escape of any heat by conduction; next, heat is communicated to the contents of the cylinder, and by its expansion at constant temperature drives the piston out; third, addi-

covered that in the genera *Cycas* and *Zamia* the immediate act of fecundation is brought about by motile spermatozooids, as is the case in the *Pteridophyta* and other lower plants, although the first development from the pollen germ is a pollen-tube, as in the case of phanerogamic plants. The relationship to the *Pteridophyta* on the one side and to the phanerogams on the other is thus clearly shown. The spermatozooids are very large and those of *Zamia* are the largest known in any plant or animal. The wood is without resin, and the pith large. The plants of this family inhabit India, Australia, the Cape of Good Hope, and tropical America. There are about 80 species, in 9 genera, of which the chief are *Cycas*, *Zamia*, *Macrozamia*, *Encephalartos*, and *Dioon*. The farinaceous pith of various species is used for food, and they are frequently cultivated in hothouses for ornament or because of their curious habit. The *Cycadaceae* are found in the various geological formations, beginning with the Permian. They are exceedingly abundant in the Mesozoic, and especially in the earlier stages of that series. On this account the Mesozoic formations are sometimes classed together as representing the "age of cycads." See *Pterophyllum*, *Zamites*, *Otozamites*, *Pterozamites*.

**cycadaceous** (sik-a-dā'shius), *a.* In *bot.*, belonging to or resembling the family *Cycadaceae*.

The pollen is contained in valvate anthers on the under surface of scales, which are united into

tion of heat is stopped, but the energy in the substance does work on the piston, increasing the volume of the substance but lowering its pressure and temperature; finally, heat is removed from the contents of the cylinder, but pressure is put on to the piston so as to preserve the temperature unchanged until the body in the cylinder is brought back to its original condition; or all these operations are reversed.—**Chinese cycle.** See *sees-agenary cycle*.—**Cycle of indiction,** an arbitrary period of 15 years used in Roman and ecclesiastical history. D. 313 is taken as the first year of the first cycle.—**Cycle of the saros, or Chaldean cycle,** a period of very nearly 6,585 days, in which eclipses recur nearly in the same way.—**Hebdomadal or heptal cycle,** a period of seven days or years, which was supposed, either in its multiple or submultiple, to govern many phenomena of animal life. *Dunston.*—**Metonic cycle,** the lunar-solar cycle, established by the Greek astronomer Meton, the first year of the first cycle beginning 432 B. C., June 27. It contained 19 years, of which 12 consisted of 12 lunations, and the other 7—that is to say, the 3d, 6th, 8th, 11th, 14th, 16th, and 19th—consisted of 13 lunations. At the end of the cycle the sun was in about the same position as at the beginning; in fact, 19 tropical years are 6,939.60 days, while 235 lunations are 6,939.66 days, so that there is a difference of only about 2 hours between the two. This cycle is used in ecclesiastical computations in determining the date of Easter. See *golden number*, under *golden*.—**Paschal cycle,** a period of 532 years, after which Easter falls on the same day of the year.—**Sexagenary cycle,** a cycle of 60 (years, days, hours, etc.) in use throughout the Chinese empire and the countries receiving their literature and civilization from China. It is said to have been contrived by the Emperor Hwang-ti, 2637 B. C. Frequently called the *Chinese cycle*.—**Solar cycle, or cycle of Sundays,** a period of 28 years, after which the days of the week, according to the old style or Julian calendar, recur on the same days of the month.—**Bothiac cycle or period,** the canicular year, *annus magnus*, or *annus vagus*, a period of 1,461 years, used in ancient Egypt.—**The epic cycle, in ancient Greek literature,** a series of epics collected and arranged by grammarians of the Alexandrine period, so as to present a continuous mythic history from the marriage of the first divine pair, Uranus and Ge (Heaven and Earth), to the death of Odysseus (Ulysses). With the exception of the *Iliad* and the *Odyssey*, only a few short passages from the poems included in this cycle have come down to us.

The term introduced into meteorology by Piddington, in 1848, as a general name for the class of extensive storms at sea that were at that time supposed to be characterized by the revolution of air in circles about a calm center.—2. Any atmospheric movement, gentle or rapid, general or local, on land or at sea, in which the wind blows spirally around and in toward a center. In the northern hemisphere the cyclonic motion is always counter-clockwise, and in the southern hemisphere it is clockwise. Cyclones generally develop into cyclonic storms. See *anticyclone*.

Cyclones occur at all hours of the day and night, whereas whirlwinds and tornadoes show a diurnal period as distinctly marked as any in meteorology. Finally, cyclones take place under conditions which involve unequal atmospheric pressures or densities at the same heights of the atmosphere, due to inequalities in the geographical distribution of temperature and humidity; but whirlwinds occur where for the time the air is unusually warm or moist, and where, consequently, temperature and humidity diminish with height at an abnormally rapid rate. Cyclones are thus phenomena resulting from a disturbance of the equilibrium of the atmosphere considered horizontally, but whirlwinds and tornadoes have their origin in a vertical disturbance of atmospheric equilibrium. Encyc. Brit., XVI. 129.

[Commonly with a capital when used with direct reference to these beings: as, *Cyclopean* architecture. See below.] Specifically—(a) Having a single eye in the middle of the forehead; in *zool.*, having a median and apparently or actually single eye. This state may be normal and permanent, as in some of the crustaceans; or normal and marking a stage of development; or monstrous, from defect of growth in the parts concerned, whereby the eyes are not separated. It occurs, for example, occasionally in the pig. (b) Single and situated in the middle of the forehead, as an eye.

A true, mean, cyclopean eye would be slightly to the right of the median line. Mind, IX. 93.

(c) Vast; gigantic: applied to an early style of masonry, sometimes imitated in later ages, constructed of stones either unhewn or more or less irregularly shaped and fitted together, usually polygonal, but in some more recent examples approaching regular horizontal courses, and often presenting joints of very perfect workmanship. Such

Cyclopean masonry.—Walls of Amos, in the Troas. (From papers of the Archaeol. Inst. of America.)

masonry was fabled to be the work of the Cyclopes. It is remarkable for the immense size of the stones commonly employed, and was most frequently used for the walls of cities and fortresses. The walls of Tiryns, near Nauplia, in Greece, mentioned by Homer, are a good specimen of Cyclopean masonry. The remains of these walls consist of three courses, of which the stones, measuring from 6 to 9 feet long, from 3 to 4 feet wide, and from 2 to 3 feet deep, are rudely shaped, irregular masses piled on one another. Examples of Cyclopean work occur in Greece, Italy, Asia Minor, and elsewhere. The more primitive Cyclopean masonry in Greece, roughly built of stones entirely unhewn, the spaces between the larger stones being filled with smaller ones, is often termed *Pelagic*.

The former lives in the hickory and appears in spring, while the latter infests the locust-tree and appears in autumn. Both species are, in the larval state, very destructive to the trees they inhabit. *Harris, Ins. Inj. to Veg., p. 103.*

**II. n.** 1. [*cap.*] One of a sect of Greek philosophers founded by Antisthenes of Athens (born about 444 B. C.), who sought to develop the ethical teachings of Socrates, whose pupil he was. The chief doctrines of the Cynics were that virtue is the only good, that the essence of virtue is self-control, and that pleasure is an evil if sought for its own sake. They were accordingly characterized by an ostentatious contempt of riches, arts, science, and amusements. The most famous Cynic was Diogenes of Sinope, a pupil of Antisthenes, who carried the doctrines of the school to an extreme and ridiculous asceticism, and is improbably said to have slept in a tub which he carried about with him. **2. By means of their ovipositors they puncture plants, depositing their eggs along it, is believed, with some irritant fluid which produces tumors commonly called galls or nut-galls. Besides the true gall-flies, the *Cynipidae* include certain inquilinous and parasitic forms. The anterior wings lack a complete costal nervure and stigma (except in *Ibalia*); the abdomen is generally compressed-ovate or ovate, rarely cultriform; and the ovipositor is subapical. Nearly 400 European cynipids have been described, and about 200 from North America, many of which latter are known only by their galls. The family is divided into five subfamilies, *Cynipinae*, *Ibalinae*, *Inquilinae*, *Allotrichinae*, and *Figitinae*. It was called by Leach *Diptolepidae*. The name of the family is also written *Cimipidae*, *Cynipites*, *Cyniphidae*, and *Cynipseae*. The terms *Cynipera* of Latreille and *Cynipidae* or *Cynipides* of Leach are synonyms of *Chalcididae*, not of the present family. See *gall*.

A genus of baboons, of the family *Cynopithecidae*. It formerly included all those baboons to which the term "dog-faced"

was applied, from the extremely prognathous jaws, giving a canine physiognomy; but it is now restricted to exclude the drill, mandrill, etc. The common baboon is *C. babuin*, inhabiting northerly parts of Africa, where it lives in troops in rocky places. In this species the tail is about one third the whole length. Closely related are the chacma, *C. porcarius*, of South Africa, and the sphinx baboon, *C. sphinx*, of West Africa. The hebe or hamadryad, *C. hamadryas*, of Abyssinia, differs in having long hair on the head and shoulders, and a shorter tail, only about one fourth of the total length. *Cynoccephalus* is nearly a synonym of *Papio*, of prior date.

It was divided by Blyth into *Digitigrada*, *Subplantigrada*, *Plantigrada*, and *Pinnigrada*. The last of these subdivisions corresponds to the *Ferae pinnipedia* of modern naturalists, the other three to the *Ferae fissipedia*.

The characters of the family are chiefly comparative or negative, being those in which the general structure recedes from the man-like type presented by the higher simians. The gradation from the highest semnopithecoïd to the lowest cynocephalus is a gentle one, though the difference between these extremes is great.

The leading forms are *Cercopithecus*, or ordinary long-tailed monkeys; *Macacus*, the macaques; and some short-tailed forms closely related to the latter, as *Inuus* and *Cynopithecus*, commonly called apes, with *Papio* or *Cynocephalus* and *Mandrilla* or *Mormon*, the dog-faced and pig-faced baboons. See *Cynopithecus*.

**Cyprinidae**<sup>1</sup> (si-prin'i-dē), *n. pl.* [NL., < *Cyprinus* + *-idae*.] A family of fresh-water fishes, typified by the genus *Cyprinus* (the carp), of varying limits with different authors. (a) In Cuvier's system, the first family of *Malacopecterygii abdominales*, having a slightly cleft mouth with weak and generally toothless jaws, the border of the mouth being formed by the intermaxillaries, and the trifling armature of the jaws consisting of the deeply indented pharyngeals; a small number of branchial rays; the body scaly; and no adipose dorsal fin. (b) In Günther's system, a family of physostomous fishes, with body generally covered with scales; head naked; margin of upper jaw formed by the intermaxillaries; mouth toothless; lower pharyngeal bones well developed, falciform and parallel with the branchial arches, and provided with teeth in two or three series; air-bladder large, divided into an anterior and a posterior portion by a constriction, or into a right and a left portion inclosed in an osseous capsule (absent in *Homaloptera*); and ovarian sacs closed. (c) In Gill's system, a family of eventognathous fishes, with the margin of the upper jaw formed by the intermaxillaries alone, the pharyngeal teeth few, and three basal branchials. Even with its narrowest limits, it is the largest family of fishes, containing nearly 1,000 species, which by some are referred to more than 200 genera, but by others to much fewer. Very numerous representatives occur in the fresh waters of North America, Europe, and Asia, and fewer in those of Africa, where they have apparently found their way in later Tertiary times. They are absent from the streams of South America, Australia, and all the islands of the Pacific ocean except those of the East Indian archipelago. About 250 species have been found in the United States, most of which are very small. In Europe and Asia species contribute largely to the food-supply of the people, but in America very few are of any economical importance. The most

valuable is the true carp, *Cyprinus carpio*, which has been introduced and is now largely cultivated in the United States. Another species widely dispersed in the ornamental goldfish, *Carassius* (or *Cyprinus*) *auratus*. *Dace*, *roach*, *chub*, *shiner*, and *minnow* are names applied to various species. By Linnaeus and the old authors all the eventognathous fishes, as cyprinids, catostomids, and cobitids, with some others, were included. It gradually underwent delimitation by many zoologists, and is now generally restricted to the carp. The common cultivated carp is *C. carpio*, of which there are many varieties. *C. auratus* is the common goldfish, but it belongs properly to a very distinct genus, *Carassius*. See *carp*.

**cysticerus** (sis-ti-sēr'kus), *n.* [NL., < Gr. *κύστις*, bladder (see *cyst*), + *κέρκος*, tail.] A cystic worm or bladder-worm; a hydatid; an encysted scolex or tenia-head; the encysted state of the larva of a tapeworm. The name was originally given as a generic term, under the impression that the so-called *Cysticerus cellulosa* was a distinct genus and species of a parasite. It is the larva of the *Tenia solium*, found in mealy pork, and developing in man into the tapeworm. It has but one tenia-head in the cyst, and the term *cysticerus* is retained as a convenient designation of such larvae. Thus, the cysticerus of the ox becomes in man *Tenia medicamentata*; the *Cysticerus piniformis* of the rabbit becomes *Tenia serrata* of the dog, wolf, or fox; the *Cysticerus fasciolaris* of the rat and mouse develops in the cat as *Tenia crassicolis*. The cystic worm of *Tenia caninus* of the dog has many heads, and is known as a censure; and the *Cenurus cerebralis* is found in the brain of sheep.

Another form of many-headed cystic worm, complicated by proliferation, is the larva of *Tenia echinococcus* of the dog, known as an echinococcus, *Echinococcus veterinorum* being found in the liver of man as well as of various domestic animals. See *tenia*, *censure*, *echinococcus*, and *scolex*.

The *cystid* is comparable to a vesicular morula.

Huxley, *Anat. Invert.*, p. 396.

(b) The cell in which the body of the mature individual is contained, as distinguished from the polypid itself.

The body and tentacular apparatus has been incorrectly regarded as a kind of individual, and opposed to the cell or *cystid* in which it is placed, as the polypid.

It is the ovum of the female, which is fecundated by becoming united with the substance of one spermatozoon, or more, of the male.

The parent-cell (*cytula*), which was formerly regarded as merely the fertilized egg-cell, differs very essentially, therefore, both in point of form (morphologically), and in point of composition (chemically), and lastly also in point of vital qualities (physiologically). Its origin is partly paternal, partly maternal; and we need not, therefore, be surprised when we see that the child which develops from this parent-cell inherits individual qualities from both parents. *Haeckel, Evol. of Man* (trans.), I, 182.

The title *czar*, though historically equivalent, like its original *Caesar*, to emperor, was not recognized as involving imperial rank at the time of its assumption by Ivan; and Peter the Great's assumption of such rank under the title of emperor, in addition to that of *czar*, was long contested by other powers.

or carrier traveling with or on a wire cable which is suspended between struts or towers. The most simple type is an endless cable which is supported by means of pulleys or sheaves, placed at the tops of two head towers, and is made to travel continuously in one direction or alternately forward and back between the towers. The material to be transported is placed in a bucket which is suspended under the cable and moves with it from one tower to the other. On reaching the tower the bucket may be removed or unloaded and is then carried by the cable back to the loading-tower. If the cable moves in one direction two or more buckets may be used by transferring the buckets when unloaded to the returning cable. Where the cableway descends a hillside, and the traffic is down grade, the weight of the loaded buckets may be used to operate the plant without the aid of a motor, the movement of the cable being controlled by a brake. In another type, largely used in the construction of docks, breakwaters, canals, subways, and reservoirs, a single cable is suspended between struts or towers and the bucket is suspended from a trolley having flanged wheels which travel on the cable, the trolley and its bucket being hauled in either direction by means of an endless wire rope passing through blocks at the tops of the towers and controlled by a winding engine. Two cables are also used with two haulage ropes, and, to prevent the sagging of the ropes, they are passed through carriers that travel on a separate cable. When the bucket is at the tower the rope-carriers are bunched near the tower, and when the bucket is drawn over, the carriers

are automatically distributed along the cable sustaining the ropes. The haulage-ropes are also passed through blocks on the trolley and can be used to raise or lower the buckets at any point of the cable. The cable may also be connected by overhead switches to run the buckets from the cable to the tracks of a telerhage system. The towers may be stationary, as in building a dam, or may be mounted upon trucks and moved along parallel tracks, as in digging canals; or one tower may be stationary and the other may travel upon a circular track. Self-filling buckets and automatic dumping-buckets are extensively used in handling sand, coal, etc. Cableways are also used in coaling war-ships at sea, the masts of the collier and the battle-ship acting as the towers of the cableway. The coal, in sacks, is hoisted to the cable, hauled to the ship, and lowered to the deck, while the war-ship tows the collier. Another type employs very long cables supported at intervals upon towers, with the hauling-rope resting on brackets that are placed at short distances apart or running over guide-rollers on the towers. This type is used for transporting large quantities of material over rough and mountainous countries, rivers, and valleys.

Twelve cards are given to each player, 4 at a time, and 4 are left on the table. There are 35 points to play for, the lower score being deducted from the higher on each hand. There are no trumps. The 6 highest cards in each suit count 1 each, except the ace, which counts 3, and the last trick counts 3, all counts being to those who win the tricks with counting cards in them. Each player in turn declares to play or pass. If he plays he may ask for the 3 of any suit in exchange for one of his own cards. If the 3 asked for is in the stock, the player loses his ask. After asking he may discard from 1 to 4 cards. He then turns the stock face up and takes from it as many as he has discarded. Those left in the stock and the discards go to the winner of the last trick. The oldest hand always leads. If the bidder fails to reach 18 he loses to both adversaries; if he passes 18 he wins from both.

**Calcium acetate**, a substance saved in large quantity as a by-product in the manufacture of wood-alcohol, and employed in making acetone, acetic acid, and the acetates of aluminium and iron used as dyes, mordants.—**Calcium bicarbonate**, a substance,  $\text{CaH}_2(\text{CO}_3)_2$ . Calcium carbonate dissolves in much larger proportion in water containing carbon-dioxide gas or carbonic acid than in pure water. It is very commonly assumed that in the former case calcium acid-carbonate or bicarbonate is formed. Such a compound, however, cannot be obtained in a separate state; the solution, on being heated or simply exposed at common temperature, gives off carbon-dioxide gas, and normal calcium carbonate separates in solid form. This separation occurs in the softening of some natural waters by boiling, in the production of one kind of scale on the interior surface of steam-boilers, and in the formation of stalactites in limestone caverns. A like behavior is observed in magnesium bicarbonate (used medicinally), manganese bicarbonate, and iron (ferrous) bicarbonate. The last-named occurs in natural chalybeate waters, which cannot long be kept clear, but must be used at the source or soon after removal from it.—**Calcium bisulphite**, a salt of calcium prepared in solution by passing an excess of sulphur-dioxide gas into milk of lime, largely used in making paper-pulp from wood, as a means of preventing acid fermentation in the manufacture of cane-sugar and in brewing.—**Calcium carbide**. This material is produced on a very large scale by applying the intense heat of an electric furnace to a mixture of anthracite or coke with limestone. The action of water on the product causes an abundant evolution of acetylene gas, which is used for illuminating purposes.—**Calcium carbonate**, a substance, often called *carbonate of lime*, both found in nature (see *calcite* and *limestone*) and artificially prepared. It is of great industrial importance, and finds numerous applications, both mechanical and chemical.—**Calcium chlorid**, a waste-product on a large scale of the Solvay process for making carbonate of soda; not to be confounded with chlorid of lime or bleaching-powder. It is used in the scientific laboratory for drying gases, and to some extent industrially to remove moisture from the air in drying fruits, etc.—**Calcium-chlorid tube**. See *tube*.—**Calcium cyanamide**, a recent and probably very valuable product of the electric furnace, obtained by the action of atmospheric nitrogen on a mixture of anthracite or coke with lime. The reaction is  $\text{CaO} + \text{C}_2 + \text{N}_2 = \text{CO} + \text{CaCN}_2$ . This substance may by simple treatment be made to yield ammonia or alkaline cyanides, or may itself be used as a fertilizer, furnishing nitrogen in available form for growing plants.—**Calcium fluoride**, a compound occurring in nature as the mineral fluor-spar. It is the chief source from which hydrofluoric acid and other fluorine compounds are obtained.—**Calcium hydroxid**. Same as *slaked lime*.—**Calcium hypochlorite**. See *hypochlorite*.—**Calcium permanganate**, a salt used, under special circumstances, in freeing drinking water from unwholesome organic matter.—**Calcium phosphate**, in *chem.*, a salt in which calcium, the metallic basis of lime, partially or wholly replaces the hydrogen of phosphoric acid. All such salts as found in nature and all those usually met with in commerce are derivatives of orthophosphoric acid. The replacement of 1, 2, and 3 atoms of hydrogen gives rise to monocalcic phosphate ( $\text{CaH}_2(\text{PO}_4)_2$ ), dicalcic phosphate ( $\text{CaHPO}_4$ ), and tricalcic or normal calcium phosphate ( $\text{Ca}_3(\text{PO}_4)_2$ ). The first of these is pretty freely soluble in water; the second and third are practically insoluble. Monocalcic phosphate is prepared upon a very large scale by the action of sulphuric acid in proper quantity upon the normal phosphate of bones, coprolites, "phosphate rock," etc., and in admixture with the calcium sulphate produced at the same time forms the so-called superphosphate of lime so largely used in agriculture.—**Calcium phosphide**, a compound produced by the action at a red heat of phosphorus on lime. On contact with water it evolves phosphuretted hydrogen gas which at once takes fire in the air and burns with a bright light. It has been proposed to make use of this fact in rendering visible the position of a life-buoy thrown overboard at sea.—**Calcium plumbate**, a salt,  $\text{Ca}_2\text{PbO}_4$ , which gives off oxygen on being strongly heated, and has been utilized for the preparation of that gas on a large scale by Kasser's process.—**Calcium silicate**, a substance which forms the essential constituent of hydraulic cement after it has become set and hardened. It also constitutes the binding material which unites the grains of quartz-sand in artificial stone made of a mixture of such sand with a strong solution of sodium silicate, molded into shape, and hardened by immersion in a solution of calcium chlorid. Also called *lime silicate*.—**Calcium sulphate**. See *gypsum*.—**Calcium sulphid**,  $\text{CaS}$ , a substance which becomes luminous after exposure to sunlight. "Concretions" are, again, distinguished from pearls as *calcospharitic bodies* which have not a cuticular origin from an epithelium, but seem to arise by free crystallisation in the mantle or other tissues.

To record the number of hours and minutes between the beginning and the end of any piece of work or other operation, a card is inserted in the apparatus and by a movement of the first lever is stamped with the exact time at that instant. On the completion of the work the same card is inserted in the apparatus and the second lever is moved, when the card is stamped with the elapsed time, or the difference in hours and minutes between the two printings on the card. **Calendar year**, the year as given in the accepted or legal calendar, namely, at present, the interval between mid-night of December 31-January 1 and the same hour a year later. The beginning of the calendar year has varied widely in different countries and at different times. For many years before 1751 it began in England on March 25. In 1751 a legal enactment placed the beginning at January 1, in accordance with the usage then prevalent in most other Christian nations.—**Greek calendar**. The Greek year was lunar, and consisted of 12 months of 29 or 30 days each—354 days altogether, 11 days short of the solar year. To establish some correspondence between the lunar and solar years, every third, sixth, and eighth year an extra month of 29 or 30 days was inserted, bringing those years to the excessive number of 383 or 384 days. The month itself was divided into three periods of 10 (or 9) days each.—**Mexican calendar**, a combination of an astrological and solar calendar which was in use in Mexico and Yucatan in pre-Columbian times. The days were arranged in groups of 20, each day being designated by the name of an object. There were thirteen numbered periods of this kind, giving an astrological period of 260 days, called *tonalamatl* in Mexico, *ch'ol k'at'* in Guatemala, and *kin katun* by the Maya. Eighteen periods of 20 days each formed a year of 360 days, to which were added 5 days to fill the solar year. While the 360 days were all assigned to certain deities, the 5 remaining days were not so assigned, and were considered unlucky. According to this system the same combination of name and number for the first day of the year occurs every 52 years.—**Perpetual calendar**, a calendar with movable parts, which can be easily adjusted so as to be correct for any date, past, present, or future.

**calorify** (ka-lor'i-fi), *v. t.* [L. *calor*, heat, + *-ify*.] To make hot; effect with heat.

**calorimeter**, *n.* The calorimeter is used to determine, in thermal units, the heat liberated or absorbed in the course of any physical or chemical process, such as change of temperature, change of state, the solution of a solid in a liquid, the mixture of liquids, chemical action, or any mechanical, electric or magnetic process involving transformations of energy. The thermal unit almost universally employed is the *calory*, that is, the amount of heat required to raise one gram, or sometimes one kilogram, of water from 0°C. to 1°C.; but other thermal quantities, the relation of which to the calory is definitely known (such as the heat of fusion of ice, or the heat of vaporization of water), are sometimes used. For the determination of specific heat the calorimeter commonly consists of a metal vessel, the water-equivalent of which is known, containing a known quantity of water of known temperature. The substance the specific heat of which is to be determined is weighed, heated to some carefully measured higher temperature, and plunged into the water, and the change in the temperature of the latter is observed. The most serious error in this operation is that arising from the exchange of heat between the calorimeter and its surroundings, and numerous devices have been employed to reduce this error to a minimum. For this purpose the calorimeter (C) is sometimes suspended within an outer chamber (O) by non-conducting supports as shown in Fig. 1. The outer surface of the calorimeter and the inner surface of the containing vessel, both of which are metal, are highly polished in order to diminish radiation. In the *Waterman calorimeter* the substance to be tested is heated in a vessel surrounded by a coil of wire through which an electric current flows. It is then placed in a cup (C, Fig. 2) with double walls, which serves as the bulb of an air-thermometer. Ice-cold water is added in quantity just sufficient to counterbalance the rise of temperature. The mercury column in the manometer tube (m) indicates the temperature of the cup. Much more perfect isolation may be obtained by using as a calorimeter a Dewar flask. This consists of a glass vessel (Fig. 3) with double walls, from the space between which the air has been carefully removed. The outer surface of the inner flask and the interior of the outer one are silvered. The exchange of heat under these conditions is exceedingly slow, and such flasks form excellent calorimeters. The determination of specific heats by means of

the fusion of ice was first suggested by Black, in the eighteenth century, who employed for this purpose a block of

Fig. 5. Bunsen's ice-calorimeter.

clear ice (Fig. 4). The substance the specific heat of which is desired is heated and then placed in a cavity (C) within the block. A slab of ice (S) serves as a cover. The amount of water melted by the enclosed body in cooling to 0°C. measures the specific heat. Lavoisier and Laplace substituted for Black's ice-block a calorimeter consisting of an inner cage containing the body to be tested, surrounded by a double-walled vessel packed with broken ice at the melting-point. The ice melted by the heat liberated from the cooling body was collected and weighed. In *Bunsen's ice-calorimeter* the amount of ice melted is determined by the change in volume which that substance undergoes when converted into the liquid form. The apparatus, which is shown in Fig. 5, consists of an inner tube of glass (a) sealed into a larger vessel of the same substance (b), the neck of which (n) is bent upward and ends in a horizontal capillary tube (c). The upper portion of the outer vessel surrounding the tube a is filled with water, below which is mercury extending continuously through the neck into the capillary tube. By means of a freezing-mixture in a, a mantle of ice is formed around the outside of the inner tube, after which the freezing-mixture is removed and the whole apparatus is packed in melting ice. If now a body the specific heat of which is to be determined is introduced into a, a portion of the ice-mantle will be melted, and, in consequence of the diminution of volume, the mercury column in the capillary tube will recede toward the neck of the calorimeter. Its movement affords a measure of the volume of ice melted, and thus of the heat liberated by the cooling body. The Bunsen ice-calorimeter is an instrument of great delicacy and is specially adapted for the measurement of very small quantities of heat. Unfortunately, the density of the ice depends somewhat upon the rapidity with which it is formed, and considerable errors are thus introduced. The heat of vaporization of water has been utilized by Joly and others for calorimetric purposes. The *Joly steam-calorimeter* depends upon the determination of the amount of moisture condensed upon the surface of a substance when the latter is plunged into an atmosphere of steam. This apparatus consists of a steam-chamber with thin metal walls, within which, suspended from an arm of a balance, hangs a small platinum scale-pan of known form. A known weight of the substance the specific heat of which is to be determined is placed on the pan, and its temperature is noted. Steam is then introduced into the chamber, and condensation occurs on the surface of the cool body, adding to its weight. When the substance has attained the temperature of the steam, and condensation is complete, the increase of weight is determined. For the determination of the specific heat of liquids and gases, various forms of calorimeter have been devised. One of these, the *continuous-flow calorimeter* of Callendar and Barnes, which has been employed in the determination of the specific heat of water at various temperatures, is shown diagrammatically in Fig. 6. It consists essentially of a

capillary tube (AB) connecting at the ends with larger tubes and sealed into a glass vacuum-jacket. The liquid the specific heat of which is to be determined enters the tube at i and flows out at o at a measured rate. By means of a fine wire stretched through the bore of the capillary tube and supplied with a known electric current, heat is imparted to the liquid. The temperatures of the inflowing liquid at A and of the outflowing liquid at B are de

terminated by means of the resistance of coils of platinum wire inserted in the larger tubes. From the amount of liquid passing in a given time and the amount of heat delivered to it electrically from the heating-wire, together with the difference of temperature at the ends of the tube, the specific heat of the liquid can be determined with great accuracy. For the determination of heats of combustion, heats of solution, and other thermochemical processes, a number of special forms of calorimeter have been devised. Among these are the *Farrar and Silberman calorimeter*, in which the heat of a chemical reaction is imparted to mercury contained in a bulb with a capillary neck, and the expansion of the liquid is noted; the *Junker calorimeter* and the *bomb calorimeters* of Berthelot and Stohmann, for the study of heats of combustion; and the *respiration calorimeter*, for the determination of the heat evolved by animals or by human subjects. Other forms, called *electrocalorimeters*, are employed for measuring the heat developed by the electric current.—*Berthelot calorimeter*. (a) An apparatus for measuring the latent heat of vaporization. It consists essentially of a glass vessel with central outlet-tube (o) connecting with a glass worm (w) for condensing the vapor formed by the evaporation of the liquid in the vessel. The worm and receiver (r) for the condensed vapor are submerged in a water-bath, the rise of temperature of which is noted. (b) A form of bomb calorimeter for the determination of the heat of combustion. See *\*calorimeter*.—*Respiration calorimeter*, a calorimeter for measuring the heat given off by a man or other animal, with appliances for respiration such that the heat and chemical components of the products of respiration which are carried away in the ventilating current of air may be measured; or the carbon dioxide and water-vapor of respiration may be absorbed and removed and a measured quantity of oxygen supplied in lieu of fresh air. The apparatus has been used to investigate problems in physiological chemistry both with man and with domestic animals such as the horse, cow, and sheep. The best-known form of respiration calorimeter is that of Professors Atwater and Rosa, with which they carried out an extended series of investigations at Wesleyan University, Middletown, Connecticut, to verify

the law of conservation of energy in the human body. Such a test involves a determination of the total energy received by the body, during a given period, in the food and drink taken, and the total energy given off by the body in the same time, chiefly heat radiated from the body and carried away in respired air, but to some extent contained in the solid and liquid excreta of the body. If muscular work is done by the body, it also must be measured and included in the output of energy. The law of the conservation of energy requires that the total energy supplied to the body in a given time shall equal the total energy given out in the same time, plus whatever increase of energy there may have been in the body during that period, or minus any decrease of energy, as the case may be. A series of experiments extending through several years gave very close balances of income and outgo, and demonstrated, as was of course expected, that the law is fulfilled in animals as well as in inorganic systems. The essential features of the calorimeter are the following: (1) a metal chamber, furnished with a chair, table, and bed, in which the subject of the experiment (usually a man) lives, eats, drinks, sleeps, and sometimes works, during a period of several days and nights. (2) Arrangements for ventilating the chamber and for analyzing and measuring the air supplied to and received from the chamber. (3) Facilities for passing food and drink into the chamber and for removing excreta. These materials are weighed and analyzed by sample, and their heat of combustion determined. (4) Facilities for measuring the heat given off by the body and the heat-equivalent of any muscular work done. The income and outgo of energy of the body are expressed in terms of heat, the total heat of combustion of the food eaten being compared with the total heat given off by the body. The analyses of the food and excreta also show the digestibility of the food; that is, the proportion of the nutrients actually utilized in the body. The complete apparatus is complicated, and each experiment is laborious and expensive. Observations are taken constantly, day and night, by several observers during the entire period of the experiment, usually lasting from four to eight days. The results obtained have been of the highest scientific value.—*Throttling calorimeter*, a device for ascertaining the moisture in steam by throttling the steam and then allowing it to expand to about atmospheric pressure. The expanded steam is somewhat superheated, the degree of superheating depending on the moisture in the steam before throttling.

**cancer**, *n.* 3. The term *cancer*, as commonly employed, includes those new growths which possess certain attributes that render them especially dangerous to life, and which are therefore called *malignant*. Malignant tumors grow by infiltration and destruction of the surrounding tissues, and are characterized by a tendency to recur after removal, by the property of spreading to other parts of the body by a process of dissemination known as *metastasis*, and by producing a general disturbance of health termed *cachexia*. From the standpoint of the pathologist two chief groups of cancerous tumors are recognized: the *carcinomata*, or true cancers, and the *sarcomata*. The fundamental difference between these two is the fact that carcinoma originates in the epithelial tissues of the body, whereas sarcoma develops from the connective tissues. This difference in origin gives rise to certain structural characteristics which enable the microscopist readily to distinguish one type from the other. Carcinoma is rare before the age of thirty; it is somewhat commoner in women than in men; and it is most often seen in the uterus, skin, breast, and stomach. Sarcoma is a disease of early adult life, is more prone to attack men than women, and is commonly found in the subcutaneous tissue, bony structures, and lymph-nodes. Carcinoma is conveyed from one part of the body to another through the lymphatic vessels, sarcoma by way of the blood-stream. In spite of an enormous amount of research devoted to this subject, the exciting cause of cancer is still unknown. The influences of heredity, climate, food, race, social condition, and local injury have all been invoked as factors concerned, but without arriving at any degree of certainty. The theory referring the development of malignant tumors to the presence of minute animal or vegetable organisms has numerous adherents, but it has not been definitely established, and many prominent authorities consider that the explanation is to be sought for in a disturbance of some still undiscovered fundamental law governing the growth of cells. Although it appears that cancer is increasing somewhat in frequency, the percentage of cures is increasing much more rapidly, owing to the earlier diagnoses and more thorough operations which are now possible. Extirpation by the knife as promptly and as completely as possible, when the growth is accessible, is regarded as the method of treatment that offers the greatest hope of a cure; but the employment of the X-rays or other form of radioactivity has in a number of instances given excellent results.

The British spherical candle is approximately 14.28 lumens. The term is sometimes used as the equivalent of *mean spherical intensity*, in which case the mean radius vector of the surface of spherical distribution is meant. See *illumination*.—**Standard candle,** a candle used in photometry as a standard of illuminating power. For many years the recognized legal standard in England and the United States has been the light of the British standard candle, and in Prussia that of a standard candle known as the 'union-candle' (*Verinskerze*). In France a standard candle called the 'star-candle' (*bougie de l'étoile*) has been much used in photometry. The British standard candle is made of spermaceti wax extracted from crude sperm-oil and having a melting-point between 112° and 115° F. A sufficient quantity of bees-wax is added to prevent undue brittleness. The candle is made in a conical mold 10 inches long and .9 inch in diameter at the bottom and .8 inch in diameter at the top. The wick is of plaited cotton so constructed as to supply 120 grains of the melted wax per hour, under normal conditions of burning. The German candle (*Verinskerze*) is made of paraffin having a melting-point of 55° C. It has a diameter of 20 millimeters and is 314 millimeters long. The wick is of twisted cotton consisting of 25 threads, and when burning under normal conditions the height of the flame should be 30 millimeters. Another standard candle, formerly used in Germany, is the Munich candle. It is a conical candle of stearin, 20.5 millimeters in diameter at the top and 23 millimeters at the base. The wick is made of 50 strands. The normal consumption is from 10.2 to 10.6 grams an hour and the normal flame-height 56 millimeters. The French star-candle is also of stearin, of which material it should burn 10 grams an hour and have a flame-height of 52.4 millimeters. It is impossible to give a definite comparison of the various standard candles, on account of the variable performance of these sources of light. Candles taken from the same package often differ in brightness by from 10 to 15 per cent. The following table contains the results of the attempts of three well-known observers to compare the candles used in different countries, taking the Munich candle as a unit. (The data are from *Palas*, "Industrial Photometry," p. 131.)

Candle.	Schilling.	Krüsa.	Voit.
Munich	100.00	100.00	100.00
German ( <i>Verinskerze</i> )	88.7	97.6	93.5
British	90.7	85.8	94.4

As a result the vegetable matter becomes carbonized and drops away from the wool as a gray powder. This is known as *wet carbonizing*. **Dry carbonizing** consists in subjecting the material for some time to the action of dry hydrochloric-acid gas at a temperature of 100° C. It is used as a powder of various degrees of fineness and is also consolidated into blocks for grinding-wheels. Carborundum is substituted for ferro-silicon in steel-making and is mixed with a strong solution of water-glass (sodium silicate) to form a paste for application to the lining of a furnace, protecting it from injury by very high temperature. It has been identified in the meteoric iron of Cañon Diablo, Arizona, and named *moissanite*.

**carburation** (kär-bü-rä'shon), *n.* [*carbur(et)* + *-ation*.] The process of impregnating with a mist of particles of liquid hydrocarbon, which vaporize in their finely divided state either at atmospheric temperatures or on heating. Atmospheric air so impregnated forms a gas which may be ignited and used in internal-combustion motors. See *carburator*.

**carburator**, *n.* 1. Carburators are also used for impregnating a current of atmospheric air with a mist or vapor from a liquid hydrocarbon so that it becomes a combustible or explosive mixture suitable for use in internal-combustion motors. In the early forms of carburator the air moved over a surface like a wick, by the capillary action in which gasoline was evaporated into the air. In later forms the air was caused to bubble through a thin layer of liquid gasoline, or was blown over the surface of the latter. In those now in use a small jet of gasoline is forced through a needle-hole, by difference of pressure, into the current of moving air at each aspiration of the working cylinder. In the float-carburators the level of gasoline in the jet-tube is kept constant by a float which closes the passage to the jet at an adjusted position, both when the car is level and when on a grade. In others the area of the fuel-nozzle is also adjusted as the demand for fuel varies. Carburators may use alcohol or kerosene as sources of carbon, but with the less volatile liquids the carburators must be vaporizers as well as atomizers, that the fuel may not separate from the air by liquefaction or condensation. This vaporization is effected by using heat above that of the atmosphere, either from an outside flame or by conducting waste heat from exhaust gases. When the carburator supplies too much fuel, the mixture burns badly in the cylinder, and unburned fuel in the exhaust gases makes them visible as smoke and produces an offensive odor. When the needle-hole becomes clogged, the motor gets no fuel and will not run.—**Compensating carburator**, a carburator which automatically regulates the amount of fuel supplied to the engine as the demand for fuel varies with the speed or the power of the motor.

**carrier**<sup>1</sup>, *n.* 5. (g) In *transportation*, a system of endless traveling-chains supporting slats, trays, or buckets, used in transporting various materials or articles in bulk or in packages over short distances, as in a factory. The most simple or *platform* type consists of two chains supported by flanged wheels running upon rails at each side and carrying steel or wooden slats that form a moving platform on which the load is placed. See fig. 1. The traveling-sidewalk and the ramp are carriers of this type. Another form consists of a series of platform-trucks moving upon rails, the trucks being secured to a single chain which travels between the rails, hauling the trucks in either direction, carrying them round the wheel at the turn of the carrier (see wheel in fig. 1), and, when reversed, on the return trip. Other types have broad slats which lap one over another to prevent the material from falling between them. Buckets of various shapes are used in place of slats, either fixed to the chains or suspended from pivots on the chains and free to adjust themselves to changes in the travel from a horizontal to a vertical direction. The buckets, when moving in a horizontal direction,

charge. This use of pivoted buckets allies the carrier to both the conveyor and the elevator, and makes it possible to use one system or machine as a conveyor in a horizontal direction and as an elevator in a vertical direction. In one type of bucket-carrier, used in handling coal, the buckets are provided with a hinged bottom for convenience in unloading and a tipping device causing each bucket to open and discharge its load at any desired point. All types of carriers are fed at intervals or continuously, and by hand or by means of automatic feeders, and all are automatic unloaders or are fitted with tripping and discharging appliances. See fig. 2. Carriers are given, various names, as *apron-carrier*, *pivoted bucket-carrier*, *slat-carrier*, etc. See *conveyor*, *elevator*, *ramp*, *feeder*, and *discharger*. (b) A framework which adapts the holder for carrying a smaller-sized plate than that for which the camera is intended.—8. The skull is narrow, the general build slender, and the length about 17 inches. The favorite color is solid black or dun; but there are silver and blue breeds. This breed does not carry messages, being bred for points only; not only does the bird fly indifferently, but its sight is partly obscured by the wattles. The birds used during the Franco-German war were largely Antwerps, and the birds now trained for long-distance flights are homiers.

**car-unloader** (kär'un-lō'dër), *n.* In *railroad-ing*, a machine for unloading flat- or gondola-cars. Two types are in use, one in which the load is pushed or plowed off the car while it is at rest or in motion, and another in which the car itself is tilted up or

turned over to discharge the load. The first type is used in railroad construction and the second to unload ore- and coal-cars. The railroad-construction machine consists of a double-share or single-share plow, as wide as the top of the car, which is drawn along the whole length of a train by means of a cable. The gondola-cars are made without end-frames and have the brake-wheel at the side, and the side-frames have doors which are hinged at the top and swing outward, a train thus forming, with the flat iron bridges between the cars, a continuous trough for its whole length. A complete train consists of a locomotive, a flat-car carrying a winding-engine (using steam from the locomotive), sixteen or more cars, and the plow and its cable. When the filled train reaches the point of discharge, it may stop to distribute the load along the length of the train, or may be kept in motion to deposit the load over a greater distance, or may be backed at the same speed as the unloading, when the entire train-load will be deposited at one point. Whatever plan is used, the operation of the machine is the same, the winding-engine by means of the cable dragging the plow along the length of the train, and the two plow-shares throwing off the load, through the swinging doors, on each side of the track. With flat-cars a plow having one share is used, which discharges the load on one side only. Another plan is to place a guide-rail on the top of a train of flat-cars and to use a double plow, the locomotive being detached and the train anchored. The engine then drags the plow along the train by means of the cable. The car-unloading machines are massive structures supporting a section of track upon a cradle. The loaded car is run into the machine, locked in the cradle, and then turned over to discharge the load.

After a sale, or other transaction, a record is made in pencil on the ribbon through the opening; then, on moving the lever, the cash-drawer is unlocked and automatically opened and the ribbon is moved onward under a glass plate where it can be read but cannot be changed; on closing the cash-drawer the cabinet is locked and cannot be used again until a new record is made or the lever moved. In some registers, combination locks control the lever and the record may be duplicated or manifolded, one record being delivered

This is usually done in the case of cast-iron pipes or other long, hollow pieces, because it is easier to hold the core in position than when casting on the side, and also because the castings are sounder. When castings are made in this manner, it is customary to pour the iron into a vertical gate at one side of the mold and let it flow into the mold at the bottom. This method is less liable to injure the mold than that of pouring direct, and gives a chance for air carried down by the falling iron to escape.

**cast**<sup>1</sup>, *n.* 14. Specifically, the impression of the interior surface of the test or skeleton of an organism, usually animal: contradistinguished from *mold* or *imprint*, which is the impression of the exterior. See *\*thimble surface*.—**Malleable castings**, small articles made by pouring into suitable molds cast-iron, which is afterward made soft and tough by heating to redness while embedded in a material, commonly oxid. of iron, which furnishes oxygen to combine with and remove carbon from the casting, thus converting it into wrought-iron from the surface inward.

**casting-machine** (kās'ting-mā-shēn'), *n.* 1. A machine for casting molten iron from a blast-furnace into pigs. Several types are in use. One is a conveyor, controlled by means of endless chains, and having overlapping, pressed-steel buckets, supported by wheels which travel on a track, each bucket being a mold for the metal. The machine may be placed in the casting-house and fed directly from the furnace, or it may be placed outside in any convenient place that can be reached by a ladle-car on an industrial railroad. When ready for operation the conveyor is set in motion, and the buckets pass under the pouring-spout of the ladle at a speed that enables the operator to fill each in turn with the hot metal. As the filled buckets move away horizontally in the open air (under slight protection from the rain) the metal solidifies, and at the delivery end the conveyor travels up an incline until it reaches the turning-wheel where each bucket is inverted, discharging its contents as a hot yet solid casting of the general shape and size of a blast-furnace pig. The castings then slide down an incline and fall into a long and narrow tank filled with water. In the tank is a traveling apron, and the pigs fall upon this apron and are carried by it under water to the end of the tank. Here the apron travels up an incline out of the water and, turning over a large wheel, delivers the now cold pigs direct to a car. The process is continuous and comparatively rapid, and the machine saves all the hard and costly labor of casting pig-iron in sand. As the empty molds travel back

to the feeding-point they are passed through a smoky fire or treated by some other process to coat the inside of each with a refractory film to prevent the hot metal from clinging to the molds. The process of cooling the pigs is

also hastened by spraying the castings with cold water while in the molds. A second type employs a conveyor having sheet-steel molds. As fast as they are filled the molds are gradually submerged in water under which they travel until the pigs are sufficiently solid to be delivered. When the metal is solid, the buckets are caused to travel up an incline to the delivery-point where they are upset and deliver the castings directly to the car. A third type employs a large number of molds which are placed radially on the edge of a large, horizontal turntable. The turning of the table causes the molds to pass in order under the ladle-car to be filled, when they travel in a circular path until the castings are sufficiently solid to be discharged by the upsetting of the molds. Pig-iron cast in such machines is said to be cleaner and in better condition for immediate use than that cast by hand labor in sand. The name is also sometimes given to small machines used in casting metals in foundries. Such machines are properly called *molding-machines* (which see).

Ostwald and Groe of Leipzig found that by flowing a negative with an ethereal solution of hydrogen peroxid the peroxid is instantly decomposed more or less completely wherever it comes in contact with the silver of the film, which acts as a catalyte, and on the evaporation of the resulting water leaves on the plate an invisible picture in unaltered peroxid which is densest where the negative is least dense, and is therefore a positive. The negative is next pressed on paper flowed with ferrous sulphate, which is then washed and developed by gallic acid to produce a dark-violet picture in writing-ink. **category**, *n.* 1. The categories are those general concepts or ideas which mark the most fundamental distinctions. Such are those of different attitudes of thought which may, or may not, be supposed to correspond to differences in things, regardless of how anybody thinks. The different schemes of categories that are influential in philosophy may be classified according as they make divisions into two, three, four, or more members. Of dualistic, or dyadic, schemes, those which distinguish two modes of thought have never been successfully attacked; especially the distinction between affirmation and negation, under which head are to be ranged a multitude of dyadic distinctions, such as the *true* and the *false*, the *good* and the *bad*. Other dyadic distinctions of fundamental importance depend upon special metaphysical theories, such as the distinction of *body* and *soul*. Still others are open to doubt on the ground that one of the two members may be a name for a heterogeneous collection, such as the distinction of *things* and *thought*, where, under 'thought', there may be included both physical phenomena and general agencies, not in themselves phenomena and yet not things. Of triadic systems of categories, the most remarkable is that of Hegel, which very few students now accept in all its details, but which is marked throughout by profound analyses. Hegel's governing idea is a philosophical unitarianism. As soon as he finds himself forced to admit that absolute reality involves a rational element, this unitarianism compels him to deny that there is any other element but rationality in it. Accordingly, he affirms that the real is the rational, and the rational is the real. Thence (largely influenced by experiments) he is led to believe that any abstract idea, allowed to brood over itself, will hatch out of itself a flat denial of itself; and from the struggle between the two is generated a more complex or involved conception nearer to the very reality. This he not only asserts in general terms, but he boldly attempts to give an actual epitome of the evolution of reality out of the barest abstraction of thought, marking the stages at which thought makes its chief halts. The concepts which mark those halts are called by Hegel the *categories*. Of course the list will be fuller or more meager according to the degree of detail with which the march of thought is described. As given by him, it falls into triads. He sometimes seems to speak as if this triadic character were merely a feature of the style of description, but he must have thought that the different conceptions were of three kinds, which he might well enough have called categories of another order. In his list are: *quality, quantity, measure; essence (as reason of existence), appearance, actuality; the subjective concept, the object, the idea*; etc. A large number of triads of categories have been signalized at different times. Such are: *beginning, middle, end; body, spirit, soul; matter, energy, consciousness; substance, attribute, relation; objects, events, relations* (B. Erdmann); *time, space, causality* (Paul Deussen); *identity in diversity, similarity in otherness, unity of whole and parts* (E. E. Constance Jones), etc. Schelling and others have advocated quadrade schemes of categories. Other notable lists of categories are: J. S. Mill's "things denoted by names," which are *feelings, substances, qualities, relations, quantity*; H. A. Aikins's five fundamental relations, *individual identity, subject and attribute, causal relations, non-causal relations between different things, thought and its object*; Herbert Nichols's categories, *quality, quantity, changeableness, lawfulness, presentativeness, personality*.

A passage of his "Poetics" to which we are referred in his "Politics" for the full explanation of his meaning does not appear in the "Poetics," as extant. The word was applied in Greek to the ritual purification of temples, etc. Plato and Xenophon (the latter using only the adjective *καθαρός*, clean), both disciples of Socrates, use it to mean a clarification of the mind induced by dying and even at the near approach of death. Aristotle means by his phrase *καθάρσις τῶν παθημάτων*

(often translated 'a purging of the passions') a mental effect of the contemplation of works of high art, especially of the choral but severely simple and solemn Greek tragedies. He has been supposed to mean a cleansing from sin; but it is certain that he does not mean this or any strictly moral effect. On the other hand, he was of a medical family, and himself compares *catharsis* to the effect of a cathartic. He probably means the brightening and clearing of the emotional state by relieving the thoughts of the burden of sordid cares and of sensual desires; and something like this is now usually understood by the word.
